| 10/24/2016 | FRITZ WINTER NORTH AMERICA, LP             | KY-0109  | Emergency Generators #1, #2, & #3 (EU72, EU73, & #4 EU74)            | 53.6       | gal/hr     | The permittee shall prepare and maintain for EU72, EU73, and EU74, within 90 days of startup, a good combustion and operation practices plan (GCOP) that defines, measures and verifies the use of operational and design practices determined as BACT for minimizing CO, VOC, PM, PM10, and PM2.5 emissions. Any revisions requested by the Division shall be made and the plan shall be maintained on site. The permittee shall operate according to the provisions of this plan at all times, including periods of startup, shutdown, and malfunction. The plan shall be incorporated into the plant standard operating procedures (SOP) and shall be made available for the Division's inspection. The plan shall include, but not be limited to:<br>i. A list of combustion optimization practices and a means of verifying the practices have occurred.<br>ii. A list of combustion and operation practices to be used to lower energy consumption and a means of verifying the practices have occurred.<br>iii. A list of the design choices determined to be BACT and verification that designs were implemented in the final construction. | 2.6         | G/HP-HR (EU72 & EU73) |

| 10/24/2016 | FRITZ WINTER NORTH AMERICA, LP             | KY-0109  | Emergency Generators #1, #2, & #3 (EU72, EU73, & EU74)               | 53.6       | gal/hr          | The permittee shall prepare and maintain for EU72, EU73, and EU74, within 90 days of startup, a good combustion and operation practices plan (GCOP) that defines, measures and verifies the use of operational and design practices determined as BACT for minimizing CO, VOC, PM, PM10, and PM2.5 emissions. Any revisions requested by the Division shall be made and the plan shall be maintained on site. The permittee shall operate according to the provisions of this plan at all times, including periods of startup, shutdown, and malfunction. The plan shall be incorporated into the plant standard operating procedures (SOP) and shall be made available for the Division's inspection. The plan shall include, but not be limited to:<br>i. A list of combustion optimization practices and a means of verifying the practices have occurred.<br>ii. A list of combustion and operation practices to be used to lower energy consumption and a means of verifying the practices have occurred.<br>iii. A list of the design choices determined to be BACT and verification that designs were implemented in the final construction. | 0.149       | G/HP-HR (EU72 & EU73) |

| 10/24/2016 | FRITZ WINTER NORTH AMERICA, LP             | KY-0109  | Emergency Generators #1, #2, & #3 (EU72, EU73, & EU74)               | 53.6       | gal/hr          | The permittee shall prepare and maintain for EU72, EU73, and EU74, within 90 days of startup, a good combustion and operation practices plan (GCOP) that defines, measures and verifies the use of operational and design practices determined as BACT for minimizing CO, VOC, PM, PM10, and PM2.5 emissions. Any revisions requested by the Division shall be made and the plan shall be maintained on site. The permittee shall operate according to the provisions of this plan at all times, including periods of startup, shutdown, and malfunction. The plan shall be incorporated into the plant standard operating procedures (SOP) and shall be made available for the Division's inspection. The plan shall include, but not be limited to:<br>i. A list of combustion optimization practices and a means of verifying the practices have occurred.<br>ii. A list of combustion and operation practices to be used to lower energy consumption and a means of verifying the practices have occurred.<br>iii. A list of the design choices determined to be BACT and verification that designs were implemented in the final construction. | 0.149       | G/HP-HR (EU72 & EU73) |

| 10/24/2016 | FRITZ WINTER NORTH AMERICA, LP                    | KY-0109  | Emergency Generators #1, #2, & #3 (EU72, EU73, & EU74)               | 53.6       | gal/hr          | The permittee shall prepare and maintain for EU72, EU73, and EU74, within 90 days of startup, a good combustion and operation practices plan (GCOP) that defines, measures and verifies the use of operational and design practices determined as BACT for minimizing CO, VOC, PM, PM10, and PM2.5 emissions. Any revisions requested by the Division shall be made and the plan shall be maintained on site. The permittee shall operate according to the provisions of this plan at all times, including periods of startup, shutdown, and malfunction. The plan shall be incorporated into the plant standard operating procedures (SOP) and shall be made available for the Division's inspection. The plan shall include, but not be limited to:<br>i. A list of combustion optimization practices and a means of verifying the practices have occurred.<br>ii. A list of combustion and operation practices to be used to lower energy consumption and a means of verifying the practices have occurred.<br>iii. A list of the design choices determined to be BACT and verification that designs were implemented in the final construction. | 4.77        | G/HP-HR (EU72 & EU73) |

| 6/5/2015   | KOHLER CO-METALS PROCESSING COMPLEX                     | WI-0271 | P10K " Diesel Powered Emergency Generator                      | 0          |                 | Expected NOx emission without controls are 0.59 tons/year and 5.9 pounds/hour. Given this low rate of NOx emissions, due to the 200 hour/year operational limitation, the Department believes, based on engineering judgment, that controls are not economically feasible for this unit. Thus, the RICE MACT remains the only control option. | 5.9         | LB/HR      |

| 2/5/2016   | LBC HOUSTON BAYPORT TERMINAL                               | TX-0783  | Storage Tanks                                                             | 0          |                 | Sixteen tanks have internal floating roofs (IFRs) with welded seams, mechanical shoe primary seals, rim-mounted secondary seals, and welded deck seams. Based on site-specific attributes, the applicant has chosen to control tanks that store benzene or organic materials with a vapor pressure greater than 0.5 psia at the maximum feed temperature or 95°F, whichever is greater. The emissions from these tanks will be routed to a vapor combustor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0.26        | T/YR                |
| 2/5/2016   | LBC HOUSTON BAYPORT TERMINAL                               | TX-0783  | Marine Loading                                                            | 0          |                 | All loading operations are conducted with submerged fill piping.<br><br>The follow requirements apply to the loading of materials with a vapor pressure greater than 0.5 psia. 1) Vapors generated during loading must be routed to a vapor combustor for control. 2) The receiving vessel must have passed an annual vapor tightness test as specified in 40 CFR Å§63.565(c) or 40 CFR Å§61.304(f). 3) Loading operations are conducted under vacuum for non-inerted, non-ocean-going ships. 4) For inerted tanker ships and ocean-going barges, a leak test per EPA Reference Method 21 will be conducted on the vapor collection system. An infrared camera for optical gas imaging may be used to assist leak testing per Method 21. Upon leak discovery, the applicant will measure the leak emission rate with a portable flow meter. Leak testing/emission measurement must be conducted for a minimum of 6 vessels or the number of inerted ocean-going vessels loaded, whichever is less, every year. Method 21 leak testing may be suspended after five years provided that all tests confirm a vapor collection efficiency of 99% or greater. | 0.11        | T/YR                |

When the tank is idle, degassing will be performed every 24 hours unless there is no standing liquid in the tank or the vapor pressure of the remaining liquid is less than 0.15 psia. Refilling operations will be uncontrolled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | 0           |      |
| 3/5/2021   | CEDAR BAYOU PLANT               | TX-0918 | MARINE LOADING                                                                                                                                | 0          |                 | All loading operations are conducted with submerged fill piping.<br><br>The follow requirements apply to the loading of materials with a vapor pressure greater than 0.5 psia. 1) Vapors generated during loading must be routed to a vapor combustor for control. 2) The receiving vessel must have passed an annual vapor tightness test as specified in 40 CFR 60.113b(c) or 40 CFR 60.113b(f). 3) Loading operations are conducted under vacuum for non-inerted, non-ocean-going ships. 4) For inerted tanker ships and ocean-going barges, a leak test per EPA Reference Method 21 will be conducted on the vapor collection system. An infrared camera for optical gas imaging may be used to assist leak testing per Method 21. Upon leak discovery, the applicant will measure the leak emission rate with a portable flow meter. Leak testing/emission measurement must be conducted for a minimum of 6 vessels or the number of inerted ocean-going vessels loaded, whichever is less, every year. Method 21 leak testing may be suspended after five years provided that all tests confirm a vapor collection efficiency of 99% or greater. | 0           |      |
| 3/14/2023  | INEOS OLIGOMERS CHOCOLATE BAYOU | TX-0955 | Fixed roof storage tanks                                                                                                                      | 0          |                 | Fixed roof tanks, painted white, has submerged fill. Air, nitrogen other purge gas, fans, blowers, or air movers may not be used on the tank, unless all the forced ventilated vapors are directed to control. Vacuum truck vents must limit VOC concentration to 100 ppmv. Frac Tanks with breathing potential must be white and bottom filled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0           |      |

| 9/21/2020 | WESTLAKE CHEMICAL OPCO, LP   | KY-0113  | EU# 025A (EPN FUG-ETH-VVa) Ethylene Plant Fugitives | 0          |                        | <p>Leak is defined as reading of 500ppmv; BACT includes:<br/>proper labeling and following the requirements in 40 CFR 60, Subpart VVa and following good work practices including:<br/>1.Construction of new and reworked piping, valves, pump systems, and compressor systems shall conform to applicable American National Standards Institute (ANSI), American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), or equivalent codes based on the material.<br/>2. New and reworked buried connectors shall be welded.<br/>3. To the extent that good engineering practice will permit, new and reworked valves and piping connections shall be reasonably accessible for leak checking during plant operation.<br/>4. Damaged, leaking, or severely rusted valves, connectors, compressor seals, agitator seals, and pump seals found by visual inspection to be leaking (e.g., process fluids) shall be tagged and replaced or repaired. All leaking components that cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging.<br/>5. Open-ended lines are required to be equipped with a cap, plug, blind flange, or second valve.<br/>6. New relief valves are required to vent to a control device for any potential releases and as a result, any fugitive emissions are reduced. Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p>               | 0           |                 |

Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p> | 0           |                 |

| 11/13/2020 | WESTLAKE VINYL, INC. - VINYL PLANT | KY-0114  | FUG-MON-H Monomer Plant Fugitives                                  | 0          |                 | <p>1.The permittee will continue to follow MACT H LDAR program as required by the regulations, and promptly repairing any leaking components in accordance with the LDAR plan.</p> <p>2.Leak is defined as a reading of 500 ppmv.</p> <p>3.The permittee will install leakless pumps with dual mechanical seals or with a barrier fluid to reduce leaks, as possible. If a leakless pump is not feasible, the permittee shall submit justification as to its technical infeasibility.</p> <p>4.The permittee will monitor new non-leakless pumps to a leak detection threshold of 500 ppm.</p> <p>5.The permittee will utilize Good Work Practices.</p> <p>Good work practices include:</p> <p>1. Construction of new and reworked piping, valves, pump systems, and compressor systems shall conform to applicable American National Standards Institute (ANSI), American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), or equivalent codes based on the material.</p> <p>2. New and reworked buried connectors shall be welded.</p> <p>3. To the extent that good engineering practice will permit, new and reworked valves and piping connections shall be reasonably accessible for leak checking during plant operation.</p> <p>4. Damaged, leaking, or severely rusted valves, connectors, compressor seals, agitator seals, and pump seals found by visual inspection to be leaking (e.g., process fluids) shall be tagged and replaced or repaired. All leaking components that cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging.</p> <p>5. Open-ended lines are required to be equipped with a cap, plug, blind flange, or second valve.</p> <p>6. New relief valves are required to vent to a control device for any potential releases and as a result, any fugitive emissions are reduced. Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p> | 0           |       |

| 9/21/2020 | WESTLAKE CHEMICAL OPCO, LP   | KY-0113 | EU# 025A (EPN FUG-ETH-VVa) Ethylene Plant Fugitives | 0          |                        | <p>The equipment leak fugitives involve process piping components (pumps, valves, connectors, etc.) to distribute the liquid and gaseous materials among process units during the manufacture of products. Emissions from those components are mostly related to leakage from seals, connection interfaces, valve stems, etc.</p> <p>Control method is the same as that for VOC BACT.</p> <p>Leak is defined as reading of 500ppmv; BACT includes:<br/>proper labeling and following the requirements in 40 CFR 60, Subpart VVa and following good work practices including:<br/>1. Construction of new and reworked piping, valves, pump systems, and compressor systems shall conform to applicable American National Standards Institute (ANSI), American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), or equivalent codes based on the material.<br/>2. New and reworked buried connectors shall be welded.<br/>3. To the extent that good engineering practice will permit, new and reworked valves and piping connections shall be reasonably accessible for leak checking during plant operation.<br/>4. Damaged, leaking, or severely rusted valves, connectors, compressor seals, agitator seals, and pump seals found by visual inspection to be leaking (e.g., process fluids) shall be tagged and replaced or repaired. All leaking components that cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging.<br/>5. Open-ended lines are required to be equipped with a cap, plug, blind flange, or second valve.<br/>6. New relief valves are required to vent to a control device for any potential releases and as a result, any fugitive emissions are reduced. Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p> | 0           |                 |

New relief valves are required to vent to a control device for any potential releases and as a result, any fugitive emissions are reduced. Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p> | 0           |        |
| 11/13/2020 | WESTLAKE VINYL, INC.- VINYL PLANT        | KY-0114 | FUG-MON-NG Monomer Plant Fugitives in Natural Gas service | 0          |                 | <p>1. EDAR program with instrument sensors consistent with 40 CFR 63, Subpart H requirements.<br/>2. Leak is defined as a reading of 500 ppmv<br/>3. Good piping design and work practices.<br/>4. Installation of high quality/compatible components to provide long term control.</p> <p>Good work practices include:<br/>1. Construction of new and reworked piping, valves, pump systems, and compressor systems shall conform to applicable American National Standards Institute (ANSI), American Petroleum Institute (API), American Society of Mechanical Engineers (ASME), or equivalent codes based on the material.<br/>2. New and reworked buried connectors shall be welded.<br/>3. To the extent that good engineering practice will permit, new and reworked valves and piping connections shall be reasonably accessible for leak checking during plant operation.<br/>4. Damaged, leaking, or severely rusted valves, connectors, compressor seals, agitator seals, and pump seals found by visual inspection to be leaking (e.g., process fluids) shall be tagged and replaced or repaired. All leaking components that cannot be repaired until a scheduled shutdown shall be identified for such repair by tagging.<br/>5. Open-ended lines are required to be equipped with a cap, plug, blind flange, or second valve.<br/>6. New relief valves are required to vent to a control device for any potential releases and as a result, any fugitive emissions are reduced. Exceptions may be made if venting relief valves to control will result in a safety concern, but this does not exempt the company from controls such as equipping the valve with a rupture disk and pressure-sensing device.</p>                                                                                                                                                                                                                                                                    | 0           |        |

## Project Identification Information

---

This document presents the proposed air dispersion modeling for evaluating the air quality impacts resulting from the construction of a new natural gas-fired combined cycle power plant on an approximately 5,855-acre site in Carson County, Texas.

TRC Environmental Corporation (TRC) has prepared this protocol following written and verbal methodologies and procedures of the Texas Commission on Environmental Quality (TCEQ) and United States Environmental Protection Agency (USEPA).

To simplify the review of this protocol, it has been written to closely follow the order of the items listed in the Reporting Requirements (Appendix P) of the TCEQ's *Air Quality Modeling Guidelines, APDG 6232, June 2024* (AQMG).

## Section 2

# Project Overview

---

Fermi Equipment Holdco, LLC (dba Fermi America) is proposing to construct a new natural gas-fired combined cycle power plant on an approximately 5,855-acre site in Carson County, Texas. The new power plant (the Project) will operate under the name Project Matador. Project Matador will provide electricity to an on-site Artificial Intelligence-focused data center campus and will not be capable of selling electricity to or receiving power from the local utility power distribution system.

The Project will consist of the installation of Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines and HRSGs equipped with Selective Catalytic Reduction (SCR) and an oxidation catalyst system for emissions control, and ancillary equipment. The Project's nominal generation capacity will be approximately 6,000 megawatts (MW). The turbines will be fired exclusively with pipeline quality natural gas.

An air quality analysis (AQA) will be conducted to demonstrate that emissions associated with this project will not cause or contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS), Prevention of Significant Deterioration (PSD) increment consumption limits, or TCEQ property line standards. Impacts from the proposed project will not cause or contribute to adverse health effects, odor nuisance potentials, or effects with respect to vegetation or corrosion. Additionally, impacts from the proposed project will not cause or contribute to adverse effects with respect to growth, visibility, and soils.

### 2.1 Type of Permit Review

Carson County is designated as an attainment or unclassifiable area with respect to the NAAQS for all criteria pollutants. The Project will result in emissions of nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOC), carbon monoxide (CO), particulate matter (PM), particulate matter with diameters of 10 microns or less (PM<sub>10</sub>), particulate matter with diameters of 2.5 microns or less (PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), sulfuric acid (H<sub>2</sub>SO<sub>4</sub>), hydrogen sulfide (H<sub>2</sub>S) and ammonia (NH<sub>3</sub>). Under the federal New Source Review (NSR) program, this Project will trigger PSD review for Ozone as VOC and NO<sub>x</sub> emissions, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub>, H<sub>2</sub>SO<sub>4</sub>, and SO<sub>2</sub>.

Table 2-1 below provides a summary of the PSD emission significance for each PSD-regulated pollutant.

**Table 2-1 Prevention of Significant Deterioration Regulatory Threshold Evaluation**

| Pollutant                      | Potential to Emit (tpy) | PSD Major Source Threshold (tpy) | Exceeds Threshold? | PSD SER (tpy) | Exceeds Threshold? | PSD Review Applies? |
|--------------------------------|-------------------------|----------------------------------|--------------------|---------------|--------------------|---------------------|
| NO <sub>x</sub>                | 1,591.48                | 250                              | Yes                |               |                    | Yes                 |
| CO                             | 2,140.86                | 250                              | Yes                |               |                    | Yes                 |
| SO <sub>2</sub>                | 282.28                  | 250                              | Yes                |               |                    | Yes                 |
| PM                             | 1,075.12                | 250                              | Yes                |               |                    | Yes                 |
| PM <sub>10</sub>               | 1,025.80                | 250                              | Yes                |               |                    | Yes                 |
| PM <sub>2.5</sub>              | 976.69                  | 250                              | Yes                |               |                    | Yes                 |
| VOC                            | 581.75                  | 250                              | Yes                |               |                    | Yes                 |
| H <sub>2</sub> SO <sub>4</sub> | 43.20                   | 250                              | No                 | 7             | Yes                | Yes                 |

## 2.2 Air Constituents Evaluated

As discussed in Section 2.1, the project will trigger PSD review for NO<sub>x</sub>, CO, SO<sub>2</sub>, H<sub>2</sub>SO<sub>4</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. To satisfy PSD review requirements, these pollutants were evaluated for comparison with the NAAQS and PSD increment consumption limits.

The TCEQ has implemented a state-specific procedure for evaluation of ground-level concentrations of SO<sub>2</sub>, hydrogen sulfide (H<sub>2</sub>S), and H<sub>2</sub>SO<sub>4</sub>. Additionally, TCEQ requires a Modeling and Effects Review Applicability (MERA) assessment of air toxics for which Effects Screening Levels (ESLs) have been established. An electronic copy of the TCEQ's Electronic Modeling Evaluation Workbook (EMEW) summarizing the inputs and results of the TCEQ state modeling conducted for the Project will be provided.

## Section 3

# Area Map

---

The Project will be situated on an approximately 5,855-acre site in Carson County, Texas, devoted to the power generation facilities and data center campus. The site is located approximately 15 miles northeast of Amarillo, TX along US Hwy 60, near intersection of US Hwy 60 and FM 2373 on north side of the road.

An Area Map (Figure 1-1) illustrating the location of the property and surrounding area is included with the application. The area map includes a true north arrow, accurate scale, the entire plant property, the location of the property relative to prominent geographical features, and significant landmarks. It includes a circle of 3,000-ft radius and a circle of one-mile radius from the property boundary. The area map includes current aerial photography to depict the land use surrounding the property.

The Area Map shows schools located within a 3,000-ft radius from the site as well as the nearest receptors (permanently occupied off-site structures).

## Section 4

# Plot Plan

---

Plot Plans were developed to show the scale, north direction, two benchmark locations, all property lines, and all emission points associated with the facilities to be permitted. Fencing will be in place along all property boundaries. The plot plans are included in Figures 1-2, 1-2A, and 1-2B submitted with the application.

A detailed modeling plot plan showing the names and locations of all emission points and structures relative to the property boundary will be provided with the AQA.

# Section 5

## Air Quality Monitoring Data

Estimates for the current ambient air background concentrations at the proposed project site may be required for two distinct and separate purposes: (1) to demonstrate that the ambient air concentrations of PSD-significant pollutants are currently in compliance with the NAAQS and (2) for use in a full impact NAAQS modeling analysis.

### 5.1 Available Background Concentrations

Based on a review of the United States Environmental Protection Agency (USEPA)'s AirData website, Fermi America proposes using data collected at monitoring stations selected following guidance from the TCEQ's *Air Quality Modeling Guidelines* (AQMG) in selecting the form of the monitored concentration for each pollutant and averaging period, as shown in Table 5-1. The data collected from these monitors meets USEPA requirements for completeness.

**Table 5-1 Proposed Ambient Air Background Monitors and Data**

| Pollutant         | Monitor Name and Monitor ID                            | County  | Averaging Period | Background Concentration |                              | Form                                                                             |

The appropriateness of using data from these monitoring stations to establish representative background concentrations will be included with the modeling.

Following guidance contained in TCEQ's AQMG, TCEQ's *Background Concentration Determination for Use in NAAQS Analyses*, September 2, 1998, and USEPA's *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, USEPA-450/4-87-007, May 1987 Fermi America concludes, as described below, that the air quality monitoring data used to establish background concentrations is representative of the area around the Project.

TCEQ's 2023 Point Source Emission Inventory (PSEI) data will be used to compare emissions within 10 km of the Project and emissions within 10 km of the selected monitors. In addition, EPA's 2020 National Emissions Inventory (NEI) data will be used to compare county-wide emissions for the Project and the selected monitors.

A map showing the locations of the proposed ambient air monitoring sites will be provided in the AQA.

## 5.2 PSD Ambient Monitoring Requirement

PSD review may require projects to conduct pre-construction ambient monitoring to characterize existing ambient air quality. However, if dispersion model predicted impacts are less than USEPA's Monitoring De Minimis Concentrations (also called significant monitoring concentrations [SMCs]), as shown in Table 5-2, preconstruction monitoring would be waived.

**Table 5-2 Monitoring De Minimis Levels**

| Pollutant                                                                                                                                                                                                                                                                                                                    | Averaging Period | Monitoring De Minimis Level  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------------------|
|                                                                                                                                                                                                                                                                                                                              |                  | ( $\mu\text{g}/\text{m}^3$ ) |
| CO                                                                                                                                                                                                                                                                                                                           | 8-hour           | 575                          |
| NO <sub>2</sub>                                                                                                                                                                                                                                                                                                              | Annual           | 14                           |
| PM <sub>10</sub>                                                                                                                                                                                                                                                                                                             | 24-hour          | 10                           |
| PM <sub>2.5</sub>                                                                                                                                                                                                                                                                                                            | 24-hour          | -- <sup>a</sup>              |
| SO <sub>2</sub>                                                                                                                                                                                                                                                                                                              | 24-hour          | 13                           |
| O <sub>3</sub>                                                                                                                                                                                                                                                                                                               | 8-hour           | -- <sup>b</sup>              |
| Notes:<br><sup>a</sup> Per Sierra Club vs. USEPA, the pre-construction requirement cannot be waived for PM <sub>2.5</sub> .<br><sup>b</sup> Ozone ambient impact analysis is required, including pre-construction monitoring, when a project proposes a net emission increase of 100 tpy or more of NO <sub>x</sub> or VOCs. |                  |                              |

The DC Circuit Court vacated the PM<sub>2.5</sub> SMC in its 2013 ruling (*Sierra Club vs. USEPA*), ruling that the USEPA could not “waive” the pre-construction monitoring requirement for PM<sub>2.5</sub>. Subsequent USEPA guidance indicates that existing air quality monitoring data, if deemed representative, can be used to satisfy pre-construction monitoring requirements.

# Section 6

## Modeling Emissions Inventory

---

### 6.1 On-Property Sources

As discussed in Section 2, Fermi America is submitting a permit application to authorize a new natural gas-fired combined cycle power plant. Emission sources associated with the Project include:

- Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines and HRSGs equipped with Selective Catalytic Reduction (SCR) and an oxidation catalyst system for emissions control;
- Two (2) ULSD black start engine generators;
- Six (6) ultra-low-sulfur diesel (ULSD) emergency generator engines;
- Two (2) ULSD fire suppression system pump engines;
- Four (4) ULSD storage tanks;
- Fifteen (15) cooling towers;
- Combustion lube oil recirculation systems with lube oil vents for each combustion turbine generator (CTG);
- Piping component fugitive emissions from the natural gas system and SCR ammonia system piping components; and
- Turbine maintenance activities that are inherently low emitting (ILE).

A table summarizing the project-related emission sources and the emission rates modeled are included in Appendix A.

### 6.2 Off-Property Sources

Off-property sources with the potential to contribute to the area of significant impact will be included in the modeling for those constituents and averaging periods that are over the SIL.

The off-property sources will be obtained from the TCEQ by requesting a retrieval of the Air Permits Allowable Database (APAD). The APAD system is the TCEQ's representation of a complete inventory and replaced the Point Source Data Base (PSDB) in 2013. The TCEQ published a *"Fact Sheet – Air Dispersion Modeling Retrievals from the Air Permits Allowable Database"*

(APAD)” which states that compared to PSDB retrievals, primary and secondary are no longer used and only sources within 50 km of the coordinates provided will be used. Therefore, the APAD retrieval that will be used in the modeling includes all sources that are within a 50 km radius of the Project.

The APAD sources will be reviewed for completeness and accuracy. In many cases, source parameters may be missing from APAD. Attempts will be made to obtain actual parameters through the review of TCEQ online records (emission inventories and permit applications). Where actual data is not able to be determined, TCEQ default pseudo-point parameters will be used.

## **6.3 Stack Parameter Justification**

### **6.3.1 Good Engineering Practice Stack Height**

Each source will be modeled at its physical release height or at the BPIP-calculated GEP stack height, whichever is lower.

### **6.3.2 Stack Parameters – Project Sources**

The emission release parameters for on-site sources are presented below:

#### **Turbine Stacks**

The turbine stacks (EPNs: HRSGA1 – HRSGA18, HRSGB1 - HRSGB18, HRSGC1 - HRSGC18, HRSGD1 - HRSGD18, HRSGE1 – HRSGE18 ) will be modeled as point sources with exhaust parameter values (i.e., velocities, diameters, and temperatures) properly identified to calculate the buoyancy and momentum rise of their emissions. The stack parameter values will be based on engineering design information.

#### **Engines**

The firewater pumps (EPNs: FPUMP1 and FUMP2), emergency engines (EPNs: EGEN1 through EGEN6), and black start generators (EPNs: ENGINE-1 and ENGINE-2) will be modeled as point sources with exhaust parameter values (i.e., velocities, diameters, and temperatures) properly identified to calculate the buoyancy and momentum rise of their emissions. The stack parameter values will be based on engineering design information.

#### **Fugitive Source Parameters**

Fugitive emissions from the cooling towers (EPNs: CT-1 through CT-15) will be modeled as a pseudo-point source at the vent’s approximate release height.

Fugitive emissions from the lube oil vents (EPNs: LOV1 through LOV90) will be modeled as a pseudo-point source at the vent's approximate release height.

Natural gas component fugitives (EPN: NGFUG) corresponding to potential piping losses will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Ammonia component fugitives (EPN: NH3FUG) correspond to potential piping losses surrounding the Selective Catalyst Reduction (SCR) units. These fugitive emissions will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Proposed inherently low emitting (ILE) turbine maintenance activities (EPN: MSSFUG) that may generate fugitive emissions will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Diesel storage tanks (EPN: TNK-DSL1 through TNK-DSL4) will be modeled as a small 1 meter x 1 meter area source with a release height of 9.1 meter, corresponding to the tank top.

### **6.3.3 Turbine Startup Shutdown Scenarios**

Higher emission rates have been quantified for NO<sub>x</sub> and CO to account for turbine startup/shutdown (SU/SD). These emissions were conservatively modeled as occurring every hour of the year. The submitted modeling will include a detailed description of the modeled emissions scenarios involving startup and shutdown operations.

### **6.3.4 Emergency Equipment Emissions**

The project includes six diesel-fired emergency generators (EPNs: EGEN1 through EGEN6) and two diesel-fired firewater pumps (EPNs: FPUMP1 and FUMP2). Emissions associated with the emergency readiness testing of these engines will be modeled.

Fermi America plans to test the emergency equipment according to the manufacturer's recommended testing schedules. A typical testing schedule for emergency engines is testing each engine once per month for a period of approximately 60 minutes. The modeling included a maximum of 60 minutes of testing emissions for the following modeled averaging periods: 8-hour CO, 24-hour PM<sub>10</sub>, and 24-hour PM<sub>2.5</sub>. Specifically, 8-hour emissions will equal the hourly emissions multiplied by 1/8, and 24-hour emissions will equal the hourly emissions multiplied by 1/24.

The USEPA's Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1-hour NO<sub>2</sub> National Ambient Air Quality Standard; March 1, 2011 states that compliance demonstrations for the 1-hour NO<sub>2</sub> NAAQS be based on emission scenarios that can logically be assumed to be relatively continuous or which occur frequently enough to contribute significantly to the annual distribution of daily maximum 1-hour concentrations. As such, the 1-hour NO<sub>2</sub> emissions associated with these intermittent sources will be modeled per USEPA guidelines, multiplying the maximum hourly emission rate by the ratio of the proposed hours per year and total available hours per year. The emission calculations include a conservative annual emissions estimate corresponding to 100 hours per year. Therefore, the modeling of 1-hour NO<sub>2</sub> emissions associated with these intermittent sources will be conservatively modeled using the annualized emissions testing schedule.

The emissions associated with emergency equipment operating during an actual emergency will not be modeled because the proposed authorization does not include such emissions.

#### **6.3.5 NO<sub>x</sub>-to-NO<sub>2</sub> Conversion**

Following guidance included in the USEPA's *Guideline on Air Quality Models; Appendix W to 40 CFR Part 51; January 17, 2017*; the Tier 2 default Ambient Ratio Method 2 (ARM2) NO<sub>x</sub>-to-NO<sub>2</sub> conversion will be utilized within the AERMOD model. The Appendix W default minimum ambient ratio of 0.5 and the maximum ambient ratio of 0.9 will be used.

#### **6.3.6 PM<sub>2.5</sub> Emissions**

The secondary PM<sub>2.5</sub> impacts will be estimated using guidance from the Appendix R of the TCEQ's AQMG. This TCEQ guidance is based on the USEPA's *Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program, April 30, 2019*. MERPs derived using the USEPA's photochemical modeling results for hypothetical sources located in Texas will be used to estimate the air quality PM<sub>2.5</sub> impacts associated with project-related emissions of NO<sub>x</sub> and SO<sub>2</sub>. These conservative secondary PM<sub>2.5</sub> impact estimates will be included in the preliminary impact determination, full impact NAAQS and full impact PSD increment consumption analyses.

### **6.4 Scaling Factors**

No additional scalars or factors are anticipated to be used in the modeling analyses.

## Section 7

# Models Proposed and Modeling Techniques

---

The American Meteorological Society / Environmental Protection Agency Regulatory Model (AERMOD), Version 24142, will be used to perform the dispersion modeling. AERMOD is the latest generation of atmospheric dispersion models suitable for industrial sources and is the model preferred by the USEPA for such applications. To facilitate the running of AERMOD, the Providence/ORIS's "BEE-Line BEEST for Windows" graphic user interface (Version 12.13) will be used.

### 7.1 Model Options

The following model options will be used in the application of the AERMOD modeling:

- Regulatory default option enabled.
- A low roughness parameter will be used based on the results of the analysis described in Section 8.
- Elevated terrain will be used for modeling the area around the project site.
- All project sources will be modeled at their actual release heights.
- Modeling receptors will be placed to a distance that clearly identifies the area of impact. The receptor grid spacing is discussed in Section 10.

### 7.2 Modeling Approach – Preliminary Impact Determination

A preliminary impact determination will be conducted to commence the modeling analysis. The purpose of the preliminary analysis is to determine whether proposed emissions from the project sources have a "significant" impact on the existing air quality. The various preliminary modeling analyses are described in the sections below.

#### 7.2.1 Modeled Emission Rates for Precursors (MERPs) Analysis

As described in Section 6.3.6, a Tier 1 approach will be used to estimate the secondary PM<sub>2.5</sub> impacts associated with the project-related precursor emissions. The secondary PM<sub>2.5</sub> impacts will be estimated using guidance from the Appendix R of the TCEQ's AQMG. That guidance is based on the USEPA's *Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program*, April 30, 2019. MERPs derived using the USEPA's photochemical modeling results for hypothetical sources located in Texas will be used to

estimate the air quality secondary PM<sub>2.5</sub> impacts associated with project-related emissions of NO<sub>x</sub> and SO<sub>2</sub>. These secondary PM<sub>2.5</sub> impacts will be included in the preliminary impact determination, full impact NAAQS and full impact PSD increment consumption analyses.

### **7.2.2 Single Source Secondary O<sub>3</sub> Analysis**

Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants. An analysis of the formation of secondary O<sub>3</sub> is necessary when emissions from a new major PSD source will exceed the PSD SERs for O<sub>3</sub> precursors (i.e., 40 tpy increases for either VOCs or NO<sub>x</sub>). If a source triggers PSD for O<sub>3</sub> based on either NO<sub>x</sub> or VOC emissions exceeding the PSD SER, then the MERP analysis must consider both NO<sub>x</sub> and VOC emissions. If required, an ozone impact analysis will be conducted following TCEQ Guidelines and USEPA guidance (USEPA, 2022).

Since ozone is formed from precursor emissions, it cannot be modeled using a traditional point source model such as AERMOD. As part of the most recent revision to the USEPA Guideline on Air Quality Modeling (40 CFR Part 51, Appendix W), USEPA promulgated a two-tier approach for addressing single-source impacts on ozone:

- Tier 1 – The first tier involves use of appropriate and technically credible relationships between emissions and ambient impacts developed from existing modeling studies deemed sufficient for evaluating a project's impact. USEPA has developed MERPs as a Tier 1 demonstration tool for ozone.
- Tier 2 – The second tier involves a more sophisticated case-by-case application of chemical transport modeling.

The assessment of ozone formation from the Project's precursor emissions will first be conducted using USEPA's Tier 1 demonstration tool for estimating single-source secondary impacts, USEPA MERPs. In TCEQ's Modeling Guidance, modeled impacts from hypothetical industrial sources located in Texas are presented for use in a MERP analysis, as obtained from USEPA's MERP guidance. Tables Q-2 and Q-3 of TCEQ's Modeling Guidance lists hypothetical MERP values from all of the hypothetical industrial sources located in Texas. If Tier 1 analysis does not demonstrate compliance, TCEQ will be consulted to discuss a Tier 2 analysis.

### **7.2.3 Area of Significant Impact (AOI) Analysis**

A preliminary impact determination is conducted to determine if the predicted off-property concentrations associated with the proposed increase in PSD-significant emissions are greater than the USEPA's SILs. No further modeling is required to

demonstrate compliance if the maximum predicted concentration is below the SIL. If the maximum predicted concentration is equal to or greater than the SIL, all on-site sources must be included in a full impact modeling analysis. Contributions from off-site sources that may impact the AOI are accounted for using ambient air monitoring data or by direct inclusion in the full impact modeling analysis. The AOI is defined as all locations with predicted concentrations that are equal to or greater than the established SILs. An ambient background concentration is added to the full impact modeling results to complete the NAAQS demonstration.

Preliminary impact determination modeling will be conducted for PSD-significant emissions of CO, NO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub> to determine whether a full impact modeling analysis is required for each pollutant and averaging period. The modeling results will be used to determine whether the predicted concentrations are greater than the SIL for each pollutant and averaging period.

#### **7.2.4 PSD Analysis**

For PSD analyses, a preliminary impact determination is conducted to determine if the predicted off-property concentrations associated with the proposed increase in PSD-significant emissions are greater than the USEPA's SMCs. If the maximum predicted concentration is less than the SMC, the demonstration is complete and no preconstruction ambient air quality monitoring is required. If the maximum concentration is greater than the SMC, representative monitoring background concentrations are collected to establish the existing air quality for the area.

Preliminary impact determination modeling will be conducted for PSD-significant emissions of CO, NO<sub>2</sub>, PM<sub>10</sub>, and SO<sub>2</sub> for comparison with the SMCs. A preliminary impact determination will not be conducted for PM<sub>2.5</sub>. Representative monitoring background PM<sub>2.5</sub> concentrations are collected to establish the existing air quality for the area.

### **7.3 Modeling Approach – Full Impact Analysis**

Full impact modeling analyses will be conducted for comparison with the NAAQS and PSD increment consumption limits for pollutants and averaging periods with preliminary impacts equal to or greater than the SIL. These modeling analyses that may be conducted are described in the sections below.

### **7.3.1 NAAQS Analysis**

NAAQS have been established for CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Compliance with the NAAQS must be demonstrated for sources with PSD-significant emissions. As discussed in Section 2.1, PSD applies to the proposed emissions of CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. If impacts exceed SIL, a NAAQS analysis will be performed for requisite pollutants and averaging periods.

### **7.3.2 PSD Increment Consumption Analysis**

PSD increment consumption limits currently exist for NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Compliance with the PSD increment consumption limits must be demonstrated for sources with PSD-significant emissions. As discussed in Section 2.1, PSD applies to the proposed emissions of NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>.

A preliminary impacts determination will first be conducted using project-related emissions to determine if a detailed PSD increment consumption analysis is required. A full impact analysis will then be performed for applicable emissions for comparison to the PSD increment consumption limits. This analysis will include PSD increment-consuming emissions from project sources and from existing and proposed PSD increment-consuming emission sources affecting the project's impact area, as listed in the TCEQ APAD inventory system and provided in the TCEQ permit file system.

## Section 8

# Selection of Dispersion Option

---

A determination of the albedo, Bowen ratio, and surface roughness length of the modeling domain must be made before an atmospheric dispersion model can be run. The TCEQ has determined the albedo values and Bowen ratios for each county in Texas. In order to maintain consistency in the modeling of all proposed projects in Texas, the TCEQ has created pre-processed meteorological data sets for the three general roughness lengths that cover each county in Texas. The modeling method preferred by the TCEQ is to choose one of these three roughness lengths based on a review of the modeling domain.

TCEQ modeling staff has provided *Air Dispersion Modeling Team Initiative to Update Meteorological Data, November 2022* as a reference in determining the appropriate roughness length for meteorological data set selection. Following this guidance, the USEPA's AERSURFACE tool was utilized to determine the surface roughness length for this project. A surface roughness of 0.075 meters was obtained for the project location, as shown below on Table 8-1. This is within the 0.001 to 0.1 range stated in the referenced TCEQ AERMOD Training document for Category 1 for the TCEQ's "low surface roughness" meteorological dataset. Therefore, the "low surface roughness" meteorological data set will be utilized in the modeling analysis. AERSURFACE files input and output files have been included in the electronic files submitted to the TCEQ.

**Table 8-1**      **Summary of AERSURFACE Inputs and Outputs**

|                                        |              |
|----------------------------------------|--------------|
| AERSURFACE Version Number:             | 24142        |
| Center UTM Easting (m):                | 265774       |
| Center UTM Northing (m):               | 3907506      |
| NLCD Land Cover (year)                 | 2021         |
| NLCD Impervious Surface (year)         | 2021         |
| NLCD Tree Canopy (year)                | 2021         |
| Study Radius (km)                      | 1            |
| Airport?                               | No           |
| Continuous Snow Cover                  | No           |
| Surface Moisture                       | Average      |
| Arid Region?                           | No           |
| Month/Season Assignment                | Default      |
| Surface Roughness Length [ $Z_0$ ] (m) | <b>0.075</b> |

## Section 9

# Building Wake Effects

---

Building downwash effects will be included in the modeling based on guidance provided in the USEPA's *User's Guide to the Building Profile Input Program, USEPA-454/R-93-038, October 1993 (Revised April 12, 2004)*. The USEPA currently requires that all building downwash be determined using the USEPA Building Profile Input Program (BPIP-PRM) subroutine. Providence/Oris 's "BEE-Line BEEST for Windows" will be used for calculating downwash parameters for this analysis. This program includes downwash software which uses the latest BPIP-PRM subroutine (Version 04274) in its calculations.

Information regarding the project structures will be entered into the BPIP-based software program. The downwash parameter values will be calculated for each point source by the software program and inserted into the AERMOD input files in the appropriate locations and formats.

Tables listing the building and tank downwash structures used in the modeling will be included in the AQA.

## Section 10

# Receptor Grids

---

The receptor grids used in the preliminary and full impacts analyses will follow the guidelines provided by the TCEQ in their AQMG. The NAD83 datum will be used for the receptor UTM coordinates. Providence/ORIS's "BEE-Line BEEST for Windows" will be used to calculate the appropriate domain boundaries. The USEPA AERMAP program (Version 24142) will be used to calculate (interpolate) the terrain elevations and local terrain maximums.

The receptor coverage utilized for the impact analyses will consist of the following:

- 25-meter spaced receptors along the fence line to a distance of 300 meters;
- 100-meter spaced receptors to a distance of one kilometer from the fence line;
- 500-meter spaced receptors to a distance of five kilometers from the fence line; and
- 1,000-meter spaced receptors to a distance up to 50 kilometers to ensure that (1) the maximum predicted concentration is located, (2) all locations with predicted concentrations greater than the SILs were identified and (3) that concentration gradients associated with the project related emissions clearly decrease in magnitude outside of the AOIs.

The receptor grids will be designed to capture the maximum off-property ground-level concentrations for all pollutants, operating scenarios, and review types.

# Section 11

## Meteorological Data

---

The air dispersion modeling for the Project will be performed using AERMOD-ready meteorological data for Carson County made available and approved through the TCEQ.

A summary of relevant information regarding the meteorological data selection is provided on Table 11-1 below.

**Table 11-1      Summary of Meteorological Data Selection**

|                                                     |                                                                              |
|-----------------------------------------------------|------------------------------------------------------------------------------|
| Surface Station ID:                                 | 23047 – AMA                                                                  |
| Upper Air Station ID:                               | 23047 – AMA                                                                  |
| Profile Base Elevation, (m):                        | 1,098                                                                        |
| AERMET Version Number:                              | 22112                                                                        |
| Was TCEQ pre-processed data used?                   | Yes                                                                          |
| TCEQ pre-processed data surface roughness category: | Low                                                                          |
| Data Set Used for 1 Year Analyses:                  | 2020                                                                         |
| Data Sets Used for 5 Years Analyses:                | 2017, 2018, 2019, 2020, 2021                                                 |
| Which analyses relied on 1 year?                    | State Property Line;<br>State Health Effects                                 |
| Which analyses relied on 5 years?                   | NO <sub>2</sub> , CO, SO <sub>2</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> |

Pre-processed meteorological data consisted of surface data and upper air data from the Amarillo International Airport (Surface ID AMA; NWS Station Number 23047)). The TCEQ processed the data using AERMET (Version 22112) and incorporated AERMINUTE data along with a low wind speed threshold of 0.5 m/s. More details regarding the pre-processed meteorological data are available on the TCEQ website.

The most recent five years of representative meteorological data (2017, 2018, 2019, 2020 and 2021) available from the TCEQ will be utilized in the NAAQS and PSD increment analyses. For the state property line and state health effects analysis modeling, a single year of representative meteorological data (2020) will be used.

The base elevation for the Amarillo International Airport station is 1,098 meters. As discussed in Section 8, the TCEQ-developed “low” surface roughness value will be utilized.

## Section 12

# Modeling Results

---

The results of the dispersion modeling that is conducted for NO<sub>2</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> to demonstrate compliance with the NAAQS and PSD increments modeling will be included in the final submittal. Copies of all modeling input and output files will be included in the electronic files submitted to the TCEQ.

## Section 13

# Class I Area Impact Analysis

---

### 13.1 Class I Area Increment Analysis

Predicted concentrations of annual NO<sub>2</sub>, 3-hour SO<sub>2</sub>, 24-hour SO<sub>2</sub>, annual SO<sub>2</sub>, 24-hour PM<sub>10</sub>, annual PM<sub>10</sub>, 24-hour PM<sub>2.5</sub>, and annual PM<sub>2.5</sub> will be modeled using the AERMOD model to determine the significance of ambient impacts at or about 50 kilometers (km) from the Project site in the direction of the nearest Class I areas, which are beyond 100-km from the Project. The PM<sub>2.5</sub> model predicted impacts will include results from secondary formation of PM<sub>2.5</sub> using distance-dependent Modeled Emission Rates for Precursors (MERPs) at distances appropriate to the nearest Class I areas.

Class I screening receptors will be developed by placing a ring of receptors at or about 50 km from the Project site. Actual Class I receptors and heights for the nearest Class I areas will be obtained from the National Park Service. Screening receptors within an arc subtended by the minimum and maximum angular directions to the Class I areas will be assigned all of the heights within that Class I area in order to develop a set of representative screening receptors at or about 50 km from the Project. Visibility and Air Quality-Related Values (AQRV)

The Project is located beyond 100 km from the nearest Class I area and therefore would not require a Class I visibility and AQRV analysis. Further, with attenuation below increment significance levels at Class I area distances we would not expect adverse impacts on any Class I area including visibility impairment or adverse effects on AQRVs.

## Section 14

# State-Only Air Quality Impact Analyses

---

### 14.1 TCEQ State Property Line Standard Analysis

TCEQ has implemented a state-specific procedure for evaluation of ground-level concentrations of SO<sub>2</sub>, H<sub>2</sub>S, and H<sub>2</sub>SO<sub>4</sub>. The Project will provide the TCEQ Electronic Modeling Evaluation Workbook (EMEW) demonstrating compliance with all applicable TCEQ State Property Line standards.

### 14.2 Health Effects Analysis

TCEQ has also implemented a state-specific procedure to evaluate off-property ground-level concentrations of pollutants which do not have a federal or state-level standard. These pollutants are compared against the state's ESLs, which are updated regularly to incorporate new toxicology data. The Project will follow the tiered MERA process as outlined in the TCEQ guidance (TCEQ, 2018). An EMEW has been provided in Appendix B, summarizing the proposed stack parameters and emission rates.

# Appendix B

## **TCEQ Electronic Modeling Evaluation Workbook**

**Texas Commission on Environmental Quality**  
**Electronic Modeling Evaluation Workbook (EMEW)**  
**General**

Date: 8-1-2025

Permit #: TBD

Company Name: Fermi Equipment Holdco LLC

TCEQ 20835, Version 3.0

**Purpose Statement:**

This workbook is completed by the applicant and submitted to the Texas Commission on Environmental Quality (TCEQ). This workbook is a tool available for all Minor New Source Review (NSR) projects using AERSCREEN, AERMOD, or ISC/ISCPrime for an impacts review and its use is required as of July 1, 2025. Provide the workbook with the permit application submittal for any Minor NSR project requiring a modeling impacts demonstration. Note: This workbook is only for AERSCREEN, AERMOD, or ISC/ISCPrime analyses. If SCREEN3 is relied on, the Electronic Modeling Evaluation Workbook (EMEW) for SCREEN3 should be used.

Projects for which pollutants trigger Prevention of Significant Deterioration (PSD) review should submit a protocol and not utilize this form. Note for projects that contain both PSD and Minor NSR reviews, the Minor NSR analyses should be documented in the EMEW and submitted with the PSD protocol. Alternatively, all Minor NSR analyses may be documented in the PSD protocol, in which case an EMEW is not required.

This workbook follows the guidance outlined in the Air Quality Modeling Guidelines (AQMG), APDG 6232 which can be found here:

[https://www.tceq.texas.gov/permitting/air/guidance/newsourcesreview/nsr\\_mod\\_guidance.html](https://www.tceq.texas.gov/permitting/air/guidance/newsourcesreview/nsr_mod_guidance.html)

Information on active TCEQ air dispersion modeling policy memos can be found here:

[https://www.tceq.texas.gov/permitting/air/memos/modeling\\_memos.html](https://www.tceq.texas.gov/permitting/air/memos/modeling_memos.html)

**General Workbook Information:**

Under Texas Government Code 559.003(a), individuals are entitled to receive and review any information collected by TCEQ about the individual by means of a form that is completed and filed with TCEQ in a paper or electronic format on the TCEQ website consistent with Texas Government Code sec., 559.003(b). The individual is also entitled to have TCEQ correct information about the individual that is incorrect.

If you have questions on how to fill out this form or about the Air Permits Division, contact us at 512-239-1250.

Accessibility Disclaimer: This workbook contains intentionally blank cells.

**Workbook Instructions:**

1. Save a copy of the workbook to your computer or desktop prior to entering data.
2. Complete all required sections leaving no blanks. Use the "tab" button or the arrow keys to move to the next available cell. Use "enter" to move down a line.
3. Fill in the workbook in order - from left to right, top to bottom, and tabs in the order they are represented. Do not skip around as this will cause errors. Use caution if changing a previously entered entry. **Note: When pasting, always use Excel's "Paste as Values" option from the right-click menu.**
4. Do not include formulas with links to other workbooks.
5. Not applicable sections of this workbook will be hidden as data is entered. For example, answering "No" to "Is downwash applicable?" will hide the sections of the workbook required only for downwash entry.
6. If the permit application is required to be submitted through State of Texas Environmental Electronic Reporting System (STEERS), the EMEW or modeling protocol (if PSD review is triggered) and any supplemental attachments (except modeling files) must be submitted as an application attachment in STEERS. All modeling files accompanying an EMEW should be submitted utilizing TCEQ Secure File Transfer Protocol (FTPS) (for initial submittal, share with [apirt@tceq.texas.gov](mailto:apirt@tceq.texas.gov)). Information accompanying an EMEW should be submitted at the same time as the application submittal. See Required Attachments and Additional Attachments (as applicable) sections below for more information on submitting supplemental information with the EMEW. Note: modeling files are highly recommended but not required for application submittal. Information on TCEQ FTPS can be found here:

<https://ftps.tceq.texas.gov/help/>

7. If printing the EMEW, follow the directions below to create a workbook header.
8. Printing the EMEW is not required for submitting to the Air Permits Division (APD); however, it might need to be printed for sending to the regional offices, local programs, and for public access if notice is required. To print the workbook, follow the instructions below. Be aware, several sheets contain large amounts of data and caution should be taken if printing, such as the Speciated Chemicals sheet and Speciated Emissions sheet.
9. Updates may be necessary throughout the review process. Updated workbooks must be submitted in electronic format to APD. For submittal to regional offices, local programs, or public places, applicant only has to print sheets that had updates. Change the headers accordingly, if applicable.

**Note:** Since this will be part of the permit application, follow the instructions in the Form PI-1 General Application on where to send copies of the EMEW and permit application. The Form PI-1 General Application can be found here:

<https://www.tceq.texas.gov/permitting/air/guidance/newsourcesreview/nsrapp-tools.html>

**Create Headers Before Printing:**

1. Right-click one of the workbook's sheet tabs and "Select All Sheets."
2. Enter the "Page Layout View" by using the navigation ribbon's View > Workbook Views > Page Layout, or by clicking the page layout icon in the lower-right corner of Excel.
3. Add the date, company name, and permit number (if known) to the upper-right header. Note that this may take up to a minute to update the spreadsheet. Select any tab to continue working on the spreadsheet.

**Printing Tips:**

1. The default printing setup for each sheet in the workbook is set for the TCEQ preferred format. The print areas are set up to not include the instructions on each sheet.
2. Applicant has access to change all printing settings to fit their needs and printed font size. Some common options include:
  - Change what area is being printed (whole active sheet or a selection);
  - Change the orientation (portrait or landscape);
  - Change the margin size; and
  - Change the scaling (all columns on one sheet, full size, custom selection, etc.).

**Final Modeling Submittal:**

Anytime final modeling files are being submitted, the applicant should notify the following: permit reviewer assigned and permit reviewer's supervisor.

The following options are available for an applicant to provide modeling (or any other files):

1. Applicant can transfer files through a File Transfer Protocol (FTP) site:
  - a. Applicant may have their own FTP site and can share the files with TCEQ staff.
  - b. Applicants can use the TCEQ FTPS site.
2. Applicant can email files smaller than 25mb.
3. Applicant can mail or hand deliver the files on an external storage device.

Instructions for setting up an account on the TCEQ FTPS site are located at:

<https://ftps.tceq.texas.gov/help/>

# Texas Commission on Environmental Quality

## Electronic Modeling Evaluation Workbook (EMEW)

### General

Date: 8-1-2025

Permit #: TBD

Company Name: Fermi Equipment Holdco LLC

| Required Attachments:                                                                                                                                                                                                                                                                                                                                                                                         |                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Notes:</b><br>1. The following are attachments that must be included with any modeling analysis.<br>2. If providing the plot plan and area map with the permit application, ensure there is also a copy with the EMEW.<br>3. For larger properties or dense source areas, provide multiple zoomed-in plot plans that are legible.<br>4. All plot plans and area maps should not be marked as confidential. |                              |
| Required Attachments                                                                                                                                                                                                                                                                                                                                                                                          | Select "X" from the dropdown |
| <b>Is a Plot Plan attached?</b><br>Make sure all property/fence lines are visible and marked, all modeled sources and buildings are clearly labeled, and a north arrow and clearly marked scale are included.                                                                                                                                                                                                 | X                            |
| <b>Is an Area Map attached?</b><br>Include all property lines, annotate schools within 3,000 ft of the nearest property line, and identify all non-industrial receptors.                                                                                                                                                                                                                                      | X                            |

#### I. Project Information

|                                                                                                                                                    |                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A. Project Overview:</b> Give a brief project overview. To type or insert text, double click in the cell (response limited to 2000 characters). | Project to install 15 6x1 combined cycle natural gas-fired combustion turbines as well as associated ancillary equipment. Includes 15 cooling towers, 90 lube oil vents, 2 fire pumps, 6 emergency generators, 2 black start generators, 4 diesel tanks and associated fugitive sources. |
|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### II. Air Dispersion Modeling Preliminary Information

**Instructions:** Fill in the information below based on the modeling setup. The selections chosen in this sheet will carry throughout the sheet and workbook. Based on selections below, only portions of the sheet and workbook will be available. Therefore, it is vital the sheet and workbook are filled out in order. Do not skip around.

For larger text boxes, double click to type or insert text.

##### A. Type of Model Used:

| Type                                     | Select "X" in all that apply |
|------------------------------------------|------------------------------|
| AERMOD                                   | X                            |
| AERSCREEN                                |                              |
| Enter in all applicable Model Version(s) | 2412                         |

##### B. Building Downwash:

| Requested Information                                                                                           | Response       |
|-----------------------------------------------------------------------------------------------------------------|----------------|
| Is building downwash applicable? Select "Yes" if a volume source will be located on or adjacent to a structure. | Choose an item |
| Enter BPIP version (AERMOD and ISCPrime only)                                                                   | 4274           |

##### C. Type of Analyses:

| Type                                                                            | Select "X" in all that apply |
|---------------------------------------------------------------------------------|------------------------------|
| Minor NSR National Ambient Air Quality Standards (NAAQS)                        |                              |
| Health Effects                                                                  | X                            |
| State Property Line                                                             | X                            |
| *PSD projects should submit a protocol or AQA report and not utilize this form. | -                            |

## Electronic Modeling Evaluation Workbook (EMEW)

Permit #: TBD

Company Name:Fermi Equipment Holdco LLC

[illegible]

**Health Effects:** Fill in the Speciated Emissions sheet with all applicable pollutants, CAS numbers, and ESLs.

### Model Options

Date: 8-1-2025

Permit #: TBD

Company Name: Fermi Equipment Holdco LLC

#### H. Receptor Grid:

For AERMOD or ISC/ISCPrime, fill in the following information on the modeled receptor grid. Note: Receptor grid resolution (tight, fine, medium, coarse) are based on recommended receptor grid spacing per the AQMG. If something outside of this is used, fully describe it below. Also, consider secondary contributions when determining significant receptors for PM<sub>2.5</sub>. See Note 2 on the Secondary Formation of PM<sub>2.5</sub> sheet for more information.

| Parameter                                                                                                                                                             | Value |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|
| <b>Tight Receptor Spacing (m)</b><br>(Per Appendix M of the AQMG, 25 meter spacing is recommended for tight receptor spacing.)                                        | 25    |
| <b>Tight Receptor Distance (m)</b><br>(Per Appendix M of the AQMG, tight receptor spacing could extend up to 200-300 meters from the sources being evaluated.)        | 300   |
| <b>Fine Receptor Spacing (m)</b><br>(Per Appendix M of the AQMG, 100 meter spacing is recommended for fine receptor spacing.)                                         | 100   |
| <b>Fine Receptor Distance (m)</b><br>(Per Appendix M of the AQMG, fine receptors could extend one kilometer from the sources being evaluated.)                        | 1000  |
| <b>Medium Receptor Spacing (m)</b><br>(Per Appendix M of the AQMG, 500 meter spacing is recommended for medium receptor spacing, as applicable.)                      | 500   |
| <b>Medium Receptor Distance (m)</b><br>(Per Appendix M of the AQMG, medium receptors could extend from one to five kilometers from the sources being evaluated.)      | 5000  |
| <b>Coarse Receptor Spacing (m)</b><br>(Per Appendix M of the AQMG, 1 kilometer spacing is recommended for coarse receptor spacing, as applicable.)                    | 1000  |
| <b>Coarse Receptor Distance (m)</b><br>(Per Appendix M of the AQMG, coarse receptors could extend out to 50 km, as needed.)                                           | 50000 |
| Describe any other receptor grid designs or locations of interest (e.g., significant receptors, over water, GLCni, SPLD, etc.) (response limited to 1500 characters). |       |
|                                                                                                                                                                       |       |

#### I. Terrain:

## Case by Case General Information-New Sites

|                                                                                                                                                                                                 |           |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| 1) Is this application a re-submittal of a project voided within the last six months?                                                                                                           | No        |
| 2) Is this application for a portable facility?                                                                                                                                                 | No        |
| 3) What type of new authorization are you applying for?                                                                                                                                         | CONSTRUCT |
| 3.1. Are there any associated federal Prevention of Significant Deterioration (PSD), Nonattainment (NA), or major source hazardous pollutants Federal Clean Air Act § 112(g) permits?           | No        |
| 3.2. Are there any Permits by Rule (PBR) or standard exemptions associated to be incorporated?                                                                                                  | No        |
| 3.3. List any PBR or standard exemptions with date claimed that need to be referenced that the TCEQ was previously not required to be notified of (unregistered PBR and standard exemptions).   | None      |
| 3.4. List any PBR or standard exemptions with date claimed that need to be consolidated that the TCEQ was previously not required to be notified of (unregistered PBR and standard exemptions). | None      |

|                                                                                                                                              |    |
|----------------------------------------------------------------------------------------------------------------------------------------------|----|
| 3.5. Are there any standard permits associated with this permit to be incorporated?                                                          | No |
| 3.6. Are there any other permits to be consolidated into this permit?                                                                        | No |
| 3.7. Are there any other permits that should be voided as part of this application for any reason other than consolidation into this permit? | No |

## Case by Case Application Requirements

|                                                                                                                                                                                                                              |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1) Is a completed Form PI-1 General Application attached with all supporting documentation?                                                                                                                                  | Yes |
| 2) Is an air quality impacts demonstration required?                                                                                                                                                                         | Yes |
| 2.1. Is the application for a major New Source Review (federal or PSD) permit?                                                                                                                                               | Yes |
| 2.1.1. Is a completed Modeling Protocol with all supporting documentation being attached?                                                                                                                                    | Yes |
| 3) Do the emissions from the proposed facility comply with all rules and regulations of the commission and with the intent of the Texas Clean Air Act (TCAA), including protection of the health and property of the public? | Yes |
| 4) Does the application contain provisions for measuring emissions of significant air contaminants?                                                                                                                          | Yes |
| 5) Does the application contain a best available control technology (BACT) evaluation for all facilities subject to the TCAA?                                                                                                | Yes |
| 6) Is the proposed facility subject to a New Source Performance Standard (Title 40 Code of Federal Regulation (CFR) Part 60 (NSPS)?                                                                                          | Yes |
| 6.1. If yes, does the application contain a NSPS evaluation for all facilities subject to the TCAA, as listed in Title 40 CFR Part 60?                                                                                       | Yes |
| 7) Is the proposed facility subject to a National Emission Standard for Hazardous Air Pollutants (Title 40 CFR Part 61) (NESHAP)?                                                                                            | No  |
| 8) Is the proposed facility subject to National Emission Standard for Hazardous Air Pollutants (Title 40 CFR Part 63) (MACT) evaluation required?                                                                            | Yes |
| 8.1. If yes, does the application contain a MACT evaluation for all facilities subject to the TCAA, as listed in Title 40 CFR Part 63?                                                                                       | Yes |
| 9) Is a nonattainment review (NA) and/or prevention of significant deterioration (PSD) evaluation required?                                                                                                                  | Yes |

|                                                                                                                                                                                                                                                                                            |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 9.1. If yes, does the application contain a NA and/or PSD evaluation for all facilities subject to the TCAA?                                                                                                                                                                               | Yes |
| 10) Does the application contain information to demonstrate that the proposed facility will achieve the performance specified in its permit?                                                                                                                                               | Yes |
| 11) If subject to Chapter 101, Subchapter H, Division 3 (relating to Mass Emissions Cap and Trade Program), the proposed facility, group of facilities, or account must obtain allowances to operate. Have the allowances been identified for the facilities contained in the application? | NA  |
| 12) Is the facility an affected source (as defined in 116.15(1)) for hazardous air pollutants?                                                                                                                                                                                             | No  |

Case by Case Table 30

|                                                                                                  |       |
|--------------------------------------------------------------------------------------------------|-------|
| 1) Do nonattainment permitting requirements apply to this application?                           | No    |
| 2) Do prevention of significant deterioration permitting requirements apply to this application? | Yes   |
| 3) Enter the total permit application fee (non-renewal) based on your estimated capital cost.    | 75000 |

Case by Case Attachments

If the file size for any attachment is greater than 50MB, then combine all non-excel files into one PDF document and use the FTP process to create an account at <a href="https://ftp.tceq.texas.gov/ut.php" onclick="return !window.open(this.href,'window\_name','resizable=true,scrollbars=yes');" style="color: blue !important;">https://ftp.tceq.texas.gov/ut.php</a>, upload files, and share to <b style="color: blue !important;">APIRT@tceq.texas.gov.</b> Detailed instructions can be found at <a href="https://ftp.tceq.texas.gov/help/" onclick="return !window.open(this.href,'window\_name','resizable=true,scrollbars=yes');" style="color: blue !important;">https://ftp.tceq.texas.gov/help/</a>.

## Certification

The electronic signature below indicates that the Responsible Official has knowledge of the facts herein set forth and that the same are true, accurate, and complete to the best of my knowledge and belief. I further state that to the best of my knowledge and belief, the project for which application is made will not in any way violate any provision of the Texas Water Code (TWC), Chapter 7, Texas Clean Air Act (TCAA), as amended, or any of the air quality rules and regulations of the Texas Commission on Environmental Quality or any local governmental ordinance or resolution enacted pursuant to the TCAA. I further state that I understand my signature indicates that this application meets all applicable nonattainment, prevention of significant deterioration, or major source of hazardous air pollutant permitting requirements. I further state that I have read and understand TWC 7.177-7.183, which defines CRIMINAL OFFENSES for certain violations, including intentionally or knowingly making or causing to be made false material statements or representations in this application, and TWC 7.187, pertaining to CRIMINAL PENALTIES.

1. I am Charles L Hamilton, the owner of the STEERS account ER115503.
2. I have the authority to sign this data on behalf of the applicant named above.
3. I have personally examined the foregoing and am familiar with its content and the content of any attachments, and based upon my personal knowledge and/or inquiry of any individual responsible for information contained herein, that this information is true, accurate, and complete.
4. I further certify that I have not violated any term in my TCEQ STEERS participation agreement and that I have no reason to believe that the confidentiality or use of my password has been compromised at any time.
5. I understand that use of my password constitutes an electronic signature legally equivalent to my written signature.
6. I also understand that the attestations of fact contained herein pertain to the implementation, oversight and enforcement of a state and/or federal environmental program and must be true and complete to the best of my knowledge.
7. I am aware that criminal penalties may be imposed for statements or omissions that I know or have reason to believe are untrue or misleading.
8. I am knowingly and intentionally signing Case-by-Case New Permit.
9. My signature indicates that I am in agreement with the information on this form, and authorize its submittal to the TCEQ.

## **Texas Commission on Environmental Quality**

### **Form APD-EXP Expedited Permit Request**

#### **Instructions**

For more information on the expedited permitting program, please refer to the document titled “Initial Implementation of the Expedited Permitting Program” on our website at:

[www.tceq.texas.gov/assets/public/permitting/air/Guidance/NewSourceReview/epp-in-impl-guide-external-6258.pdf](http://www.tceq.texas.gov/assets/public/permitting/air/Guidance/NewSourceReview/epp-in-impl-guide-external-6258.pdf).

#### **I. Contact Information**

List the legal name of the company, corporation, partnership, or person who is requesting to expedite the processing of the application. List the Customer Reference Number (CN) and the Regulated Entity Number (RN). Provide the name, telephone number, and e-mail address of the company official or technical contact. This person must have the authority to make binding agreements and representations on behalf of the applicant. Make sure all contact information matches the information provided on the application form associated with this request (e.g., PI-1).

#### **II. Project Information**

List the facility name, permit number, and project number, as applicable. Enter NA if this request accompanies an initial permit. This information should match the application form associated with this request (e.g., PI-1).

#### **III. Economic Justification**

Title 30 Texas Administrative Code (TAC) Chapter 101, Subchapter J, allows for permits to be expedited if the applicant can demonstrate that a project will “benefit the economy of this state or an area of this state.” Confirm that the purpose of the application associated with this request form will benefit the economy of this state or an area of this state by checking the appropriate box.

#### **IV. Delinquent Fees and Penalties**

The Air Permits Division will not expedite this application if any delinquent fees and applicable penalties are owed to the TCEQ or the Office of the Attorney General on behalf of the TCEQ, in accordance with TCEQ protocol for delinquent fees and penalties.

#### **V. Signature**

Please make sure a signature of the company official or technical contact is included in the application submitted to the TCEQ.

| The signature below confirms that I have knowledge of the facts included in this application and that these facts are true and correct to the best of my knowledge and belief. As the applicant, I commit to fulfilling all expectations of the expedited permitting program and application requirements promptly. Failure to meet any expectation or requirement may cause my application to be removed from the expedited permitting program and possibly voided at the discretion of the TCEQ Executive Director. The signature further signifies awareness that intentionally or knowingly making or causing to be made false material statements or representations in the application is a criminal offense subject to criminal penalties. |                                                                     |

**Texas Commission on Environmental Quality**  
**Table 2**  
**Material Balance**

This material balance table is used to quantify possible emissions of air contaminants and special emphasis should be placed on potential air contaminants, for example: If feed contains sulfur, show distribution to all products. Please relate each material (or group of materials) listed to its respective location in the process flow diagram by assigning emission point numbers (taken from the flow diagram) to each material.

| List every material involved in each of the following groups | Emission Point No. from Flow Diagram | Process Rate <sup>1</sup><br>Check appropriate column at right to indicate process rate method. | Measurement | Estimation | Calculation |
|--------------------------------------------------------------|--------------------------------------|-------------------------------------------------------------------------------------------------|-------------|------------|-------------|
| Raw Materials - Input                                        |                                      |                                                                                                 |             |            |             |

## Project Identification Information

---

This document presents the proposed air dispersion modeling for evaluating the air quality impacts resulting from the construction of a new natural gas-fired combined cycle power plant on an approximately 5,855-acre site in Carson County, Texas.

TRC Environmental Corporation (TRC) has prepared this protocol following written and verbal methodologies and procedures of the Texas Commission on Environmental Quality (TCEQ) and United States Environmental Protection Agency (USEPA).

To simplify the review of this protocol, it has been written to closely follow the order of the items listed in the Reporting Requirements (Appendix P) of the TCEQ's *Air Quality Modeling Guidelines, APDG 6232, June 2024* (AQMG).

## Section 2

# Project Overview

---

Fermi Equipment Holdco, LLC (dba Fermi America) is proposing to construct a new natural gas-fired combined cycle power plant on an approximately 5,855-acre site in Carson County, Texas. The new power plant (the Project) will operate under the name Project Matador. Project Matador will provide electricity to an on-site Artificial Intelligence-focused data center campus and will not be capable of selling electricity to or receiving power from the local utility power distribution system.

The Project will consist of the installation of Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines and HRSGs equipped with Selective Catalytic Reduction (SCR) and an oxidation catalyst system for emissions control, and ancillary equipment. The Project's nominal generation capacity will be approximately 6,000 megawatts (MW). The turbines will be fired exclusively with pipeline quality natural gas.

An air quality analysis (AQA) will be conducted to demonstrate that emissions associated with this project will not cause or contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS), Prevention of Significant Deterioration (PSD) increment consumption limits, or TCEQ property line standards. Impacts from the proposed project will not cause or contribute to adverse health effects, odor nuisance potentials, or effects with respect to vegetation or corrosion. Additionally, impacts from the proposed project will not cause or contribute to adverse effects with respect to growth, visibility, and soils.

### 2.1 Type of Permit Review

Carson County is designated as an attainment or unclassifiable area with respect to the NAAQS for all criteria pollutants. The Project will result in emissions of nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOC), carbon monoxide (CO), particulate matter (PM), particulate matter with diameters of 10 microns or less (PM<sub>10</sub>), particulate matter with diameters of 2.5 microns or less (PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), sulfuric acid (H<sub>2</sub>SO<sub>4</sub>), hydrogen sulfide (H<sub>2</sub>S) and ammonia (NH<sub>3</sub>). Under the federal New Source Review (NSR) program, this Project will trigger PSD review for Ozone as VOC and NO<sub>x</sub> emissions, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub>, H<sub>2</sub>SO<sub>4</sub>, and SO<sub>2</sub>.

Table 2-1 below provides a summary of the PSD emission significance for each PSD-regulated pollutant.

**Table 2-1 Prevention of Significant Deterioration Regulatory Threshold Evaluation**

| Pollutant                      | Potential to Emit (tpy) | PSD Major Source Threshold (tpy) | Exceeds Threshold? | PSD SER (tpy) | Exceeds Threshold? | PSD Review Applies? |
|--------------------------------|-------------------------|----------------------------------|--------------------|---------------|--------------------|---------------------|
| NO <sub>x</sub>                | 1,591.48                | 250                              | Yes                |               |                    | Yes                 |
| CO                             | 2,140.86                | 250                              | Yes                |               |                    | Yes                 |
| SO <sub>2</sub>                | 282.28                  | 250                              | Yes                |               |                    | Yes                 |
| PM                             | 1,075.12                | 250                              | Yes                |               |                    | Yes                 |
| PM <sub>10</sub>               | 1,025.80                | 250                              | Yes                |               |                    | Yes                 |
| PM <sub>2.5</sub>              | 976.69                  | 250                              | Yes                |               |                    | Yes                 |
| VOC                            | 581.75                  | 250                              | Yes                |               |                    | Yes                 |
| H <sub>2</sub> SO <sub>4</sub> | 43.20                   | 250                              | No                 | 7             | Yes                | Yes                 |

## 2.2 Air Constituents Evaluated

As discussed in Section 2.1, the project will trigger PSD review for NO<sub>x</sub>, CO, SO<sub>2</sub>, H<sub>2</sub>SO<sub>4</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. To satisfy PSD review requirements, these pollutants were evaluated for comparison with the NAAQS and PSD increment consumption limits.

The TCEQ has implemented a state-specific procedure for evaluation of ground-level concentrations of SO<sub>2</sub>, hydrogen sulfide (H<sub>2</sub>S), and H<sub>2</sub>SO<sub>4</sub>. Additionally, TCEQ requires a Modeling and Effects Review Applicability (MERA) assessment of air toxics for which Effects Screening Levels (ESLs) have been established. An electronic copy of the TCEQ's Electronic Modeling Evaluation Workbook (EMEW) summarizing the inputs and results of the TCEQ state modeling conducted for the Project will be provided.

## Section 3

# Area Map

---

The Project will be situated on an approximately 5,855-acre site in Carson County, Texas, devoted to the power generation facilities and data center campus. The site is located approximately 15 miles northeast of Amarillo, TX along US Hwy 60, near intersection of US Hwy 60 and FM2373 on north side of the road.

An Area Map (Figure 1-1) illustrating the location of the property and surrounding area is included with the application. The area map includes a true north arrow, accurate scale, the entire plant property, the location of the property relative to prominent geographical features, and significant landmarks. It includes a circle of 3,000-ft radius and a circle of one-mile radius from the property boundary. The area map includes current aerial photography to depict the land use surrounding the property.

The Area Map shows schools located within a 3,000-ft radius from the site as well as the nearest receptors (permanently occupied off-site structures).

## Section 4

# Plot Plan

---

Plot Plans were developed to show the scale, north direction, two benchmark locations, all property lines, and all emission points associated with the facilities to be permitted. Fencing will be in place along all property boundaries. The plot plans are included in Figures 1-2, 1-2A, and 1-2B submitted with the application.

A detailed modeling plot plan showing the names and locations of all emission points and structures relative to the property boundary will be provided with the AQA.

## Section 5

# Air Quality Monitoring Data

Estimates for the current ambient air background concentrations at the proposed project site may be required for two distinct and separate purposes: (1) to demonstrate that the ambient air concentrations of PSD-significant pollutants are currently in compliance with the NAAQS and (2) for use in a full impact NAAQS modeling analysis.

### 5.1 Available Background Concentrations

Based on a review of the United States Environmental Protection Agency (USEPA)'s AirData website, Fermi America proposes using data collected at monitoring stations selected following guidance from the TCEQ's *Air Quality Modeling Guidelines* (AQMG) in selecting the form of the monitored concentration for each pollutant and averaging period, as shown in Table 5-1. The data collected from these monitors meets USEPA requirements for completeness.

**Table 5-1 Proposed Ambient Air Background Monitors and Data**

| Pollutant         | Monitor Name and Monitor ID                            | County  | Averaging Period | Background Concentration |                              | Form                                                                             |

The appropriateness of using data from these monitoring stations to establish representative background concentrations will be included with the modeling.

Following guidance contained in TCEQ's AQMG, TCEQ's *Background Concentration Determination for Use in NAAQS Analyses*, September 2, 1998, and USEPA's *Ambient Monitoring Guidelines for Prevention of Significant Deterioration (PSD)*, USEPA-450/4-87-007, May 1987 Fermi America concludes, as described below, that the air quality monitoring data used to establish background concentrations is representative of the area around the Project.

TCEQ's 2023 Point Source Emission Inventory (PSEI) data will be used to compare emissions within 10 km of the Project and emissions within 10 km of the selected monitors. In addition, EPA's 2020 National Emissions Inventory (NEI) data will be used to compare county-wide emissions for the Project and the selected monitors.

A map showing the locations of the proposed ambient air monitoring sites will be provided in the AQA.

## 5.2 PSD Ambient Monitoring Requirement

PSD review may require projects to conduct pre-construction ambient monitoring to characterize existing ambient air quality. However, if dispersion model predicted impacts are less than USEPA's Monitoring De Minimis Concentrations (also called significant monitoring concentrations [SMCs]), as shown in Table 5-2, preconstruction monitoring would be waived.

**Table 5-2 Monitoring De Minimis Levels**

| Pollutant                                                                                                                                                                                                                                                                                                                    | Averaging Period | Monitoring De Minimis Level  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|------------------------------|
|                                                                                                                                                                                                                                                                                                                              |                  | ( $\mu\text{g}/\text{m}^3$ ) |
| CO                                                                                                                                                                                                                                                                                                                           | 8-hour           | 575                          |
| NO <sub>2</sub>                                                                                                                                                                                                                                                                                                              | Annual           | 14                           |
| PM <sub>10</sub>                                                                                                                                                                                                                                                                                                             | 24-hour          | 10                           |
| PM <sub>2.5</sub>                                                                                                                                                                                                                                                                                                            | 24-hour          | -- <sup>a</sup>              |
| SO <sub>2</sub>                                                                                                                                                                                                                                                                                                              | 24-hour          | 13                           |
| O <sub>3</sub>                                                                                                                                                                                                                                                                                                               | 8-hour           | -- <sup>b</sup>              |
| Notes:<br><sup>a</sup> Per Sierra Club vs. USEPA, the pre-construction requirement cannot be waived for PM <sub>2.5</sub> .<br><sup>b</sup> Ozone ambient impact analysis is required, including pre-construction monitoring, when a project proposes a net emission increase of 100 tpy or more of NO <sub>x</sub> or VOCs. |                  |                              |

The DC Circuit Court vacated the PM<sub>2.5</sub> SMC in its 2013 ruling (*Sierra Club vs. USEPA*), ruling that the USEPA could not “waive” the pre-construction monitoring requirement for PM<sub>2.5</sub>. Subsequent USEPA guidance indicates that existing air quality monitoring data, if deemed representative, can be used to satisfy pre-construction monitoring requirements.

# Section 6

## Modeling Emissions Inventory

---

### 6.1 On-Property Sources

As discussed in Section 2, Fermi America is submitting a permit application to authorize a new natural gas-fired combined cycle power plant. Emission sources associated with the Project include:

- Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines and HRSGs equipped with Selective Catalytic Reduction (SCR) and an oxidation catalyst system for emissions control;
- Two (2) ULSD black start engine generators;
- Six (6) ultra-low-sulfur diesel (ULSD) emergency generator engines;
- Two (2) ULSD fire suppression system pump engines;
- Four (4) ULSD storage tanks;
- Fifteen (15) cooling towers;
- Combustion lube oil recirculation systems with lube oil vents for each combustion turbine generator (CTG);
- Piping component fugitive emissions from the natural gas system and SCR ammonia system piping components; and
- Turbine maintenance activities that are inherently low emitting (ILE).

A table summarizing the project-related emission sources and the emission rates modeled are included in Appendix A.

### 6.2 Off-Property Sources

Off-property sources with the potential to contribute to the area of significant impact will be included in the modeling for those constituents and averaging periods that are over the SIL.

The off-property sources will be obtained from the TCEQ by requesting a retrieval of the Air Permits Allowable Database (APAD). The APAD system is the TCEQ's representation of a complete inventory and replaced the Point Source Data Base (PSDB) in 2013. The TCEQ published a *"Fact Sheet – Air Dispersion Modeling Retrievals from the Air Permits Allowable Database"*

(APAD)” which states that compared to PSDB retrievals, primary and secondary are no longer used and only sources within 50 km of the coordinates provided will be used. Therefore, the APAD retrieval that will be used in the modeling includes all sources that are within a 50 km radius of the Project.

The APAD sources will be reviewed for completeness and accuracy. In many cases, source parameters may be missing from APAD. Attempts will be made to obtain actual parameters through the review of TCEQ online records (emission inventories and permit applications). Where actual data is not able to be determined, TCEQ default pseudo-point parameters will be used.

## **6.3 Stack Parameter Justification**

### **6.3.1 Good Engineering Practice Stack Height**

Each source will be modeled at its physical release height or at the BPIP-calculated GEP stack height, whichever is lower.

### **6.3.2 Stack Parameters – Project Sources**

The emission release parameters for on-site sources are presented below:

#### **Turbine Stacks**

The turbine stacks (EPNs: HRSGA1 – HRSGA18, HRSGB1 - HRSGB18, HRSGC1 - HRSGC18, HRSGD1 - HRSGD18, HRSGE1 – HRSGE18 ) will be modeled as point sources with exhaust parameter values (i.e., velocities, diameters, and temperatures) properly identified to calculate the buoyancy and momentum rise of their emissions. The stack parameter values will be based on engineering design information.

#### **Engines**

The firewater pumps (EPNs: FPUMP1 and FUMP2), emergency engines (EPNs: EGEN1 through EGEN6), and black start generators (EPNs: ENGINE-1 and ENGINE-2) will be modeled as point sources with exhaust parameter values (i.e., velocities, diameters, and temperatures) properly identified to calculate the buoyancy and momentum rise of their emissions. The stack parameter values will be based on engineering design information.

#### **Fugitive Source Parameters**

Fugitive emissions from the cooling towers (EPNs: CT-1 through CT-15) will be modeled as a pseudo-point source at the vent’s approximate release height.

Fugitive emissions from the lube oil vents (EPNs: LOV1 through LOV90) will be modeled as a pseudo-point source at the vent's approximate release height.

Natural gas component fugitives (EPN: NGFUG) corresponding to potential piping losses will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Ammonia component fugitives (EPN: NH3FUG) correspond to potential piping losses surrounding the Selective Catalyst Reduction (SCR) units. These fugitive emissions will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Proposed inherently low emitting (ILE) turbine maintenance activities (EPN: MSSFUG) that may generate fugitive emissions will be modeled as a small 1 meter x 1 meter area source with a release height of 1 meter.

Diesel storage tanks (EPN: TNK-DSL1 through TNK-DSL4) will be modeled as a small 1 meter x 1 meter area source with a release height of 9.1 meter, corresponding to the tank top.

### **6.3.3 Turbine Startup Shutdown Scenarios**

Higher emission rates have been quantified for NO<sub>x</sub> and CO to account for turbine startup/shutdown (SU/SD). These emissions were conservatively modeled as occurring every hour of the year. The submitted modeling will include a detailed description of the modeled emissions scenarios involving startup and shutdown operations.

### **6.3.4 Emergency Equipment Emissions**

The project includes six diesel-fired emergency generators (EPNs: EGEN1 through EGEN6) and two diesel-fired firewater pumps (EPNs: FPUMP1 and FUMP2). Emissions associated with the emergency readiness testing of these engines will be modeled.

Fermi America plans to test the emergency equipment according to the manufacturer's recommended testing schedules. A typical testing schedule for emergency engines is testing each engine once per month for a period of approximately 60 minutes. The modeling included a maximum of 60 minutes of testing emissions for the following modeled averaging periods: 8-hour CO, 24-hour PM<sub>10</sub>, and 24-hour PM<sub>2.5</sub>. Specifically, 8-hour emissions will equal the hourly emissions multiplied by 1/8, and 24-hour emissions will equal the hourly emissions multiplied by 1/24.

The USEPA's Additional Clarification Regarding Application of Appendix W Modeling Guidance for the 1-hour NO<sub>2</sub> National Ambient Air Quality Standard; March 1, 2011 states that compliance demonstrations for the 1-hour NO<sub>2</sub> NAAQS be based on emission scenarios that can logically be assumed to be relatively continuous or which occur frequently enough to contribute significantly to the annual distribution of daily maximum 1-hour concentrations. As such, the 1-hour NO<sub>2</sub> emissions associated with these intermittent sources will be modeled per USEPA guidelines, multiplying the maximum hourly emission rate by the ratio of the proposed hours per year and total available hours per year. The emission calculations include a conservative annual emissions estimate corresponding to 100 hours per year. Therefore, the modeling of 1-hour NO<sub>2</sub> emissions associated with these intermittent sources will be conservatively modeled using the annualized emissions testing schedule.

The emissions associated with emergency equipment operating during an actual emergency will not be modeled because the proposed authorization does not include such emissions.

#### **6.3.5 NO<sub>x</sub>-to-NO<sub>2</sub> Conversion**

Following guidance included in the USEPA's *Guideline on Air Quality Models; Appendix W to 40 CFR Part 51; January 17, 2017*; the Tier 2 default Ambient Ratio Method 2 (ARM2) NO<sub>x</sub>-to-NO<sub>2</sub> conversion will be utilized within the AERMOD model. The Appendix W default minimum ambient ratio of 0.5 and the maximum ambient ratio of 0.9 will be used.

#### **6.3.6 PM<sub>2.5</sub> Emissions**

The secondary PM<sub>2.5</sub> impacts will be estimated using guidance from the Appendix R of the TCEQ's AQMG. This TCEQ guidance is based on the USEPA's *Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program, April 30, 2019*. MERPs derived using the USEPA's photochemical modeling results for hypothetical sources located in Texas will be used to estimate the air quality PM<sub>2.5</sub> impacts associated with project-related emissions of NO<sub>x</sub> and SO<sub>2</sub>. These conservative secondary PM<sub>2.5</sub> impact estimates will be included in the preliminary impact determination, full impact NAAQS and full impact PSD increment consumption analyses.

### **6.4 Scaling Factors**

No additional scalars or factors are anticipated to be used in the modeling analyses.

## Section 7

# Models Proposed and Modeling Techniques

---

The American Meteorological Society / Environmental Protection Agency Regulatory Model (AERMOD), Version 24142, will be used to perform the dispersion modeling. AERMOD is the latest generation of atmospheric dispersion models suitable for industrial sources and is the model preferred by the USEPA for such applications. To facilitate the running of AERMOD, the Providence/ORIS's "BEE-Line BEEST for Windows" graphic user interface (Version 12.13) will be used.

### 7.1 Model Options

The following model options will be used in the application of the AERMOD modeling:

- Regulatory default option enabled.
- A low roughness parameter will be used based on the results of the analysis described in Section 8.
- Elevated terrain will be used for modeling the area around the project site.
- All project sources will be modeled at their actual release heights.
- Modeling receptors will be placed to a distance that clearly identifies the area of impact. The receptor grid spacing is discussed in Section 10.

### 7.2 Modeling Approach – Preliminary Impact Determination

A preliminary impact determination will be conducted to commence the modeling analysis. The purpose of the preliminary analysis is to determine whether proposed emissions from the project sources have a "significant" impact on the existing air quality. The various preliminary modeling analyses are described in the sections below.

#### 7.2.1 Modeled Emission Rates for Precursors (MERPs) Analysis

As described in Section 6.3.6, a Tier 1 approach will be used to estimate the secondary PM<sub>2.5</sub> impacts associated with the project-related precursor emissions. The secondary PM<sub>2.5</sub> impacts will be estimated using guidance from the Appendix R of the TCEQ's AQMG. That guidance is based on the USEPA's *Guidance on the Development of Modeled Emission Rates for Precursors (MERPs) as a Tier 1 Demonstration Tool for Ozone and PM<sub>2.5</sub> under the PSD Permitting Program*, April 30, 2019. MERPs derived using the USEPA's photochemical modeling results for hypothetical sources located in Texas will be used to

estimate the air quality secondary PM<sub>2.5</sub> impacts associated with project-related emissions of NO<sub>x</sub> and SO<sub>2</sub>. These secondary PM<sub>2.5</sub> impacts will be included in the preliminary impact determination, full impact NAAQS and full impact PSD increment consumption analyses.

### **7.2.2 Single Source Secondary O<sub>3</sub> Analysis**

Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants. An analysis of the formation of secondary O<sub>3</sub> is necessary when emissions from a new major PSD source will exceed the PSD SERs for O<sub>3</sub> precursors (i.e., 40 tpy increases for either VOCs or NO<sub>x</sub>). If a source triggers PSD for O<sub>3</sub> based on either NO<sub>x</sub> or VOC emissions exceeding the PSD SER, then the MERP analysis must consider both NO<sub>x</sub> and VOC emissions. If required, an ozone impact analysis will be conducted following TCEQ Guidelines and USEPA guidance (USEPA, 2022).

Since ozone is formed from precursor emissions, it cannot be modeled using a traditional point source model such as AERMOD. As part of the most recent revision to the USEPA Guideline on Air Quality Modeling (40 CFR Part 51, Appendix W), USEPA promulgated a two-tier approach for addressing single-source impacts on ozone:

- Tier 1 – The first tier involves use of appropriate and technically credible relationships between emissions and ambient impacts developed from existing modeling studies deemed sufficient for evaluating a project's impact. USEPA has developed MERPs as a Tier 1 demonstration tool for ozone.
- Tier 2 – The second tier involves a more sophisticated case-by-case application of chemical transport modeling.

The assessment of ozone formation from the Project's precursor emissions will first be conducted using USEPA's Tier 1 demonstration tool for estimating single-source secondary impacts, USEPA MERPs. In TCEQ's Modeling Guidance, modeled impacts from hypothetical industrial sources located in Texas are presented for use in a MERP analysis, as obtained from USEPA's MERP guidance. Tables Q-2 and Q-3 of TCEQ's Modeling Guidance lists hypothetical MERP values from all of the hypothetical industrial sources located in Texas. If Tier 1 analysis does not demonstrate compliance, TCEQ will be consulted to discuss a Tier 2 analysis.

### **7.2.3 Area of Significant Impact (AOI) Analysis**

A preliminary impact determination is conducted to determine if the predicted off-property concentrations associated with the proposed increase in PSD-significant emissions are greater than the USEPA's SILs. No further modeling is required to

demonstrate compliance if the maximum predicted concentration is below the SIL. If the maximum predicted concentration is equal to or greater than the SIL, all on-site sources must be included in a full impact modeling analysis. Contributions from off-site sources that may impact the AOI are accounted for using ambient air monitoring data or by direct inclusion in the full impact modeling analysis. The AOI is defined as all locations with predicted concentrations that are equal to or greater than the established SILs. An ambient background concentration is added to the full impact modeling results to complete the NAAQS demonstration.

Preliminary impact determination modeling will be conducted for PSD-significant emissions of CO, NO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and SO<sub>2</sub> to determine whether a full impact modeling analysis is required for each pollutant and averaging period. The modeling results will be used to determine whether the predicted concentrations are greater than the SIL for each pollutant and averaging period.

#### **7.2.4 PSD Analysis**

For PSD analyses, a preliminary impact determination is conducted to determine if the predicted off-property concentrations associated with the proposed increase in PSD-significant emissions are greater than the USEPA's SMCs. If the maximum predicted concentration is less than the SMC, the demonstration is complete and no preconstruction ambient air quality monitoring is required. If the maximum concentration is greater than the SMC, representative monitoring background concentrations are collected to establish the existing air quality for the area.

Preliminary impact determination modeling will be conducted for PSD-significant emissions of CO, NO<sub>2</sub>, PM<sub>10</sub>, and SO<sub>2</sub> for comparison with the SMCs. A preliminary impact determination will not be conducted for PM<sub>2.5</sub>. Representative monitoring background PM<sub>2.5</sub> concentrations are collected to establish the existing air quality for the area.

### **7.3 Modeling Approach – Full Impact Analysis**

Full impact modeling analyses will be conducted for comparison with the NAAQS and PSD increment consumption limits for pollutants and averaging periods with preliminary impacts equal to or greater than the SIL. These modeling analyses that may be conducted are described in the sections below.

### **7.3.1 NAAQS Analysis**

NAAQS have been established for CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Compliance with the NAAQS must be demonstrated for sources with PSD-significant emissions. As discussed in Section 2.1, PSD applies to the proposed emissions of CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. If impacts exceed SIL, a NAAQS analysis will be performed for requisite pollutants and averaging periods.

### **7.3.2 PSD Increment Consumption Analysis**

PSD increment consumption limits currently exist for NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. Compliance with the PSD increment consumption limits must be demonstrated for sources with PSD-significant emissions. As discussed in Section 2.1, PSD applies to the proposed emissions of NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>.

A preliminary impacts determination will first be conducted using project-related emissions to determine if a detailed PSD increment consumption analysis is required. A full impact analysis will then be performed for applicable emissions for comparison to the PSD increment consumption limits. This analysis will include PSD increment-consuming emissions from project sources and from existing and proposed PSD increment-consuming emission sources affecting the project's impact area, as listed in the TCEQ APAD inventory system and provided in the TCEQ permit file system.

## Section 8

# Selection of Dispersion Option

---

A determination of the albedo, Bowen ratio, and surface roughness length of the modeling domain must be made before an atmospheric dispersion model can be run. The TCEQ has determined the albedo values and Bowen ratios for each county in Texas. In order to maintain consistency in the modeling of all proposed projects in Texas, the TCEQ has created pre-processed meteorological data sets for the three general roughness lengths that cover each county in Texas. The modeling method preferred by the TCEQ is to choose one of these three roughness lengths based on a review of the modeling domain.

TCEQ modeling staff has provided *Air Dispersion Modeling Team Initiative to Update Meteorological Data, November 2022* as a reference in determining the appropriate roughness length for meteorological data set selection. Following this guidance, the USEPA's AERSURFACE tool was utilized to determine the surface roughness length for this project. A surface roughness of 0.075 meters was obtained for the project location, as shown below on Table 8-1. This is within the 0.001 to 0.1 range stated in the referenced TCEQ AERMOD Training document for Category 1 for the TCEQ's "low surface roughness" meteorological dataset. Therefore, the "low surface roughness" meteorological data set will be utilized in the modeling analysis. AERSURFACE files input and output files have been included in the electronic files submitted to the TCEQ.

**Table 8-1**      **Summary of AERSURFACE Inputs and Outputs**

|                                        |              |
|----------------------------------------|--------------|
| AERSURFACE Version Number:             | 24142        |
| Center UTM Easting (m):                | 265774       |
| Center UTM Northing (m):               | 3907506      |
| NLCD Land Cover (year)                 | 2021         |
| NLCD Impervious Surface (year)         | 2021         |
| NLCD Tree Canopy (year)                | 2021         |
| Study Radius (km)                      | 1            |
| Airport?                               | No           |
| Continuous Snow Cover                  | No           |
| Surface Moisture                       | Average      |
| Arid Region?                           | No           |
| Month/Season Assignment                | Default      |
| Surface Roughness Length [ $Z_0$ ] (m) | <b>0.075</b> |

## Section 9

# Building Wake Effects

---

Building downwash effects will be included in the modeling based on guidance provided in the USEPA's *User's Guide to the Building Profile Input Program*, USEPA-454/R-93-038, October 1993 (Revised April 12, 2004). The USEPA currently requires that all building downwash be determined using the USEPA Building Profile Input Program (BPIP-PRM) subroutine. Providence/Oris 's "BEE-Line BEEST for Windows" will be used for calculating downwash parameters for this analysis. This program includes downwash software which uses the latest BPIP-PRM subroutine (Version 04274) in its calculations.

Information regarding the project structures will be entered into the BPIP-based software program. The downwash parameter values will be calculated for each point source by the software program and inserted into the AERMOD input files in the appropriate locations and formats.

Tables listing the building and tank downwash structures used in the modeling will be included in the AQA.

## Section 10

# Receptor Grids

---

The receptor grids used in the preliminary and full impacts analyses will follow the guidelines provided by the TCEQ in their AQMG. The NAD83 datum will be used for the receptor UTM coordinates. Providence/ORIS's "BEE-Line BEEST for Windows" will be used to calculate the appropriate domain boundaries. The USEPA AERMAP program (Version 24142) will be used to calculate (interpolate) the terrain elevations and local terrain maximums.

The receptor coverage utilized for the impact analyses will consist of the following:

- 25-meter spaced receptors along the fence line to a distance of 300 meters;
- 100-meter spaced receptors to a distance of one kilometer from the fence line;
- 500-meter spaced receptors to a distance of five kilometers from the fence line; and
- 1,000-meter spaced receptors to a distance up to 50 kilometers to ensure that (1) the maximum predicted concentration is located, (2) all locations with predicted concentrations greater than the SILs were identified and (3) that concentration gradients associated with the project related emissions clearly decrease in magnitude outside of the AOIs.

The receptor grids will be designed to capture the maximum off-property ground-level concentrations for all pollutants, operating scenarios, and review types.

# Section 11

## Meteorological Data

The air dispersion modeling for the Project will be performed using AERMOD-ready meteorological data for Carson County made available and approved through the TCEQ.

A summary of relevant information regarding the meteorological data selection is provided on Table 11-1 below.

**Table 11-1 Summary of Meteorological Data Selection**

|                                                     |                                                                              |
|-----------------------------------------------------|------------------------------------------------------------------------------|
| Surface Station ID:                                 | 23047 – AMA                                                                  |
| Upper Air Station ID:                               | 23047 – AMA                                                                  |
| Profile Base Elevation, (m):                        | 1,098                                                                        |
| AERMET Version Number:                              | 22112                                                                        |
| Was TCEQ pre-processed data used?                   | Yes                                                                          |
| TCEQ pre-processed data surface roughness category: | Low                                                                          |
| Data Set Used for 1 Year Analyses:                  | 2020                                                                         |
| Data Sets Used for 5 Years Analyses:                | 2017, 2018, 2019, 2020, 2021                                                 |
| Which analyses relied on 1 year?                    | State Property Line;<br>State Health Effects                                 |
| Which analyses relied on 5 years?                   | NO <sub>2</sub> , CO, SO <sub>2</sub> , PM <sub>10</sub> , PM <sub>2.5</sub> |

Pre-processed meteorological data consisted of surface data and upper air data from the Amarillo International Airport (Surface ID AMA; NWS Station Number 23047)). The TCEQ processed the data using AERMET (Version 22112) and incorporated AERMINUTE data along with a low wind speed threshold of 0.5 m/s. More details regarding the pre-processed meteorological data are available on the TCEQ website.

The most recent five years of representative meteorological data (2017, 2018, 2019, 2020 and 2021) available from the TCEQ will be utilized in the NAAQS and PSD increment analyses. For the state property line and state health effects analysis modeling, a single year of representative meteorological data (2020) will be used.

The base elevation for the Amarillo International Airport station is 1,098 meters. As discussed in Section 8, the TCEQ-developed “low” surface roughness value will be utilized.

## Section 12

# Modeling Results

---

The results of the dispersion modeling that is conducted for NO<sub>2</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> to demonstrate compliance with the NAAQS and PSD increments modeling will be included in the final submittal. Copies of all modeling input and output files will be included in the electronic files submitted to the TCEQ.

## Section 13

# Class I Area Impact Analysis

---

### 13.1 Class I Area Increment Analysis

Predicted concentrations of annual NO<sub>2</sub>, 3-hour SO<sub>2</sub>, 24-hour SO<sub>2</sub>, annual SO<sub>2</sub>, 24-hour PM<sub>10</sub>, annual PM<sub>10</sub>, 24-hour PM<sub>2.5</sub>, and annual PM<sub>2.5</sub> will be modeled using the AERMOD model to determine the significance of ambient impacts at or about 50 kilometers (km) from the Project site in the direction of the nearest Class I areas, which are beyond 100-km from the Project. The PM<sub>2.5</sub> model predicted impacts will include results from secondary formation of PM<sub>2.5</sub> using distance-dependent Modeled Emission Rates for Precursors (MERPs) at distances appropriate to the nearest Class I areas.

Class I screening receptors will be developed by placing a ring of receptors at or about 50 km from the Project site. Actual Class I receptors and heights for the nearest Class I areas will be obtained from the National Park Service. Screening receptors within an arc subtended by the minimum and maximum angular directions to the Class I areas will be assigned all of the heights within that Class I area in order to develop a set of representative screening receptors at or about 50 km from the Project. Visibility and Air Quality-Related Values (AQRV)

The Project is located beyond 100 km from the nearest Class I area and therefore would not require a Class I visibility and AQRV analysis. Further, with attenuation below increment significance levels at Class I area distances we would not expect adverse impacts on any Class I area including visibility impairment or adverse effects on AQRVs.

## Section 14

# State-Only Air Quality Impact Analyses

---

### 14.1 TCEQ State Property Line Standard Analysis

TCEQ has implemented a state-specific procedure for evaluation of ground-level concentrations of SO<sub>2</sub>, H<sub>2</sub>S, and H<sub>2</sub>SO<sub>4</sub>. The Project will provide the TCEQ Electronic Modeling Evaluation Workbook (EMEW) demonstrating compliance with all applicable TCEQ State Property Line standards.

### 14.2 Health Effects Analysis

TCEQ has also implemented a state-specific procedure to evaluate off-property ground-level concentrations of pollutants which do not have a federal or state-level standard. These pollutants are compared against the state's ESLs, which are updated regularly to incorporate new toxicology data. The Project will follow the tiered MERA process as outlined in the TCEQ guidance (TCEQ, 2018). An EMEW has been provided in Appendix B, summarizing the proposed stack parameters and emission rates.
