# Section 1

## Introduction

---

### 1.1 Project Overview

Fermi Equipment Holdco, LLC (dba Fermi America) is submitting this air permit application to authorize the construction of a natural gas-fired combined cycle power plant at a greenfield site in Carson County, Texas. The new power plant will operate under the name Fermi America Project Matador (Project Matador). Project Matador will provide electricity to an on-site hyperscale data center campus designed for next-generation data and Artificial Intelligence (AI) infrastructure. The Project's power generation will be used solely onsite, and the Project will not sell electricity to the local utility power distribution system. This Project supports state and national policy goals for AI infrastructure expansion, and national energy security.

Carson County is designated as an attainment or unclassifiable area for all criteria pollutants. The Project will result in emissions of nitrogen oxides (NO<sub>x</sub>), volatile organic compounds (VOC), carbon monoxide (CO), particulate matter (PM), particulate matter with diameters of 10 microns or less (PM<sub>10</sub>), particulate matter with diameters of 2.5 microns or less (PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), sulfuric acid (H<sub>2</sub>SO<sub>4</sub>), ammonia (NH<sub>3</sub>), and Greenhouse Gas (GHG) emissions quantified as carbon dioxide equivalent (CO<sub>2e</sub>).

Under the federal New Source Review (NSR) program, this Project will trigger Prevention of Significant Deterioration (PSD) review for Ozone as VOC and NO<sub>x</sub> emissions, CO, PM<sub>10</sub>/PM<sub>2.5</sub>, NO<sub>x</sub>, SO<sub>2</sub>, and GHG emissions. A consolidated permit application is being submitted for the NSR permit, non-GHG PSD permit, and GHG PSD permit.

### 1.2 Facility Overview

Fermi America has not finalized their selection of combustion turbine configurations and Original Equipment Manufacturers (OEM) for the combustion turbine equipment due to the uncertainty in availability of gas-fired turbines in the current marketplace. As such, this initial NSR and PSD application proposes an initial configuration of combined cycle units to establish the worst-case Potential-to-Emit (PTE) for the turbines to be permitted. Specifically, the Project PTE for the CTGs will be based on:

- Fifteen (15) 6-on-1 combined cycle combustion turbine (CCCT) generator configurations. Each combustion turbine will be equipped with a heat recovery steam generators (HRSG) such that the 6-on-1 CCCT includes six HRSGs. The HRSGs will not be equipped with supplemental duct burners.

- In the 6-on-1 configuration, steam from the six (6) HRSGs will serve a single steam turbine generator.
- The 15 CCCT configurations will be comprised of 90 Siemens Energy SGT-800 combustion turbines, 15 steam turbines and ancillary equipment. Turbine performance and emissions data for the Siemens Energy SGT-800 equipment is included with this application.

The Project site plan is structured into multiple zones, and construction of the Project will occur in phases, with each phase consisting of construction of a power block designated as power blocks A through E. Each of the five (5) power blocks will consist of three (3) 6-on-1 CCCT configurations. At full build out, Project's nominal generation capacity will be approximately 6,000 megawatts (MW). The turbines will be fired exclusively with pipeline quality natural gas.

The Project will include installation of the following equipment:

- Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines and HRSGs equipped with Selective Catalytic Reduction (SCR) and an oxidation catalyst system for emissions control;
- Fifteen (15) cooling towers;
- Six (6) ultra-low-sulfur diesel (ULSD) emergency generator engines;
- Two (2) ULSD black start engine generators;
- Two (2) ULSD fire suppression system pump engines;
- Four (4) ULSD storage tanks;
- Combustion lube oil recirculation systems with lube oil vents for each combustion turbine generator (CTG);
- Piping component fugitive emissions from the natural gas system and SCR ammonia system piping components;
- Turbine maintenance activities that are inherently low emitting (ILE); and
- Sulfur Hexafluoride (SF<sub>6</sub>) insulated electrical equipment.

### 1.3 Area Map and Plot Plan

The Project will be situated on an approximately 5,855-acre site in Carson County, Texas that will be devoted to the power generation facilities and AI data center campus. The site is located approximately 15 miles northeast of Amarillo, Texas along US Hwy 60, near the intersection of US Hwy 60 and FM 2373 on north side of the road.

The enclosed Area Map, **Figure 1-1**, has been included with this application to illustrate the location of the property and surrounding area. The area map includes a true north arrow,

accurate scale, the entire plant property, the location of the property relative to prominent geographical features, and significant landmarks. **Figure 1-1** includes a circle of 3,000-ft radius and a circle of one-mile radius from the property boundary. The area map includes current aerial photography to depict the land use surrounding Project Matador. As shown, there are no schools located within a 3,000-ft radius from the site.

The enclosed Plot Plans, **Figures 1-2, 1-2A, and 1-2B**, shows the scale, north direction, two benchmark locations, all property lines, and all emission points associated with the facilities to be permitted in this application.

## Section 2

# Application Materials

---

This application has been prepared in accordance with 30 TAC Chapter 116, Subchapter B. A completed Excel workbook Form PI-1 General Application (version 6.1) with additional support information is included in this submittal.

### 2.1 TCEQ Forms and Information

All supporting documentation required for the air quality permit application is provided in this application in accordance with Texas Commission on Environmental Quality (TCEQ) guidance. A discussion of Project emission rates, federal permitting applicability, public notice applicability, professional engineer certification, permit fee and expedited permitting are provided in Sections 2.2 through 2.7 of this section, respectively.

A project description and process flow diagram are presented in Section 3. Emission calculations are described in Section 4 of this application. A discussion of Best Available Control Technology (BACT) is provided in Section 5 and in the *TCEQ Form PI-1 General Application*. Identification of applicable regulatory requirements and compliance with these requirements is demonstrated in Section 6 (State Regulatory Requirements) and Section 7 (Federal Regulatory Requirements). To assist in the review of this submittal, the following appendices are included:

#### 2.1.1 Administrative Tables and Forms (Appendix A)

Appendix A of this application contains the following TCEQ Permit Application Forms and items required to complete the permit application:

- Form PI-1 General Application; Excel workbook file (version 6.1)
- TCEQ Core Data Form
- Form APD-EXP Expedited Permitting Request
- Form APD-APS Air Permitting Surcharge Payment
- TCEQ Plain Language Summary for New Source Review (NSR) Initial Permits; English and Spanish
- TCEQ Public Involvement Plan (PIP) Form
- TCEQ Table 2 *Material Balance*
- TCEQ Table 7(a) *Vertical Fixed Roof Storage Tank Summary*

### **2.1.2 Emission Calculations (Appendix B)**

Appendix B of this application contains detailed emission calculations and emission rate summary tables used in support of the permit application.

### **2.1.3 BACT Supporting Documents (Appendix C)**

A summary of RACT/BACT/LAER Clearinghouse (RBLC) permit limits for applicable pollutants from similar facilities is provided in Appendix C of this application.

### **2.1.4 PSD Modeling Protocol and EMEW (Appendix D)**

Appendix D of this application contains the PSD Air Dispersion Modeling Protocol and Electronic Modeling Evaluation Workbook (EMEW) for Non-SCREEN3 (version 3.0) submitted in support of the application. A final AQA and modeling report will be submitted after consultation with TCEQ.

### **2.1.5 Professional Engineer Certification (Appendix E)**

Appendix E of this application contains the Professional Engineer (P.E.) Certification.

## **2.2 Sitewide Emissions to be Authorized**

A summary of the MAER for the sources to be permitted is provided in the Unit Types – Emission Rates section of the Form PI-1 General Application, which reflects the site-wide summary of emission sources.

## **2.3 Federal Permitting Applicability**

The Project will be located in Carson County, Texas. Carson County is designated as attainment or unclassifiable area for all criteria pollutants. Therefore, Nonattainment New Source Review (NNSR) applicability is not required for this Project. The PSD applicability is discussed in Section 2.3.1.

### 2.3.1 PSD Applicability

The Project is a fossil fuel-fired steam electric plant and is a listed PSD source category in 40 Code of Federal Regulations (CFR) §52.21(b)(1)(i) and therefore the PSD applicability threshold is 100 tons per year (tpy) of a regulated PSD pollutant. The Project will have potential to emit over 100 tpy of a regulated PSD pollutant and is a major stationary source with respect to 40 CFR 52.21(b)(1)(i).

**Table 2-1** provides a summary of PSD applicability determination for each non-GHG NSR pollutant. The Project increases are shown on the respective Table 1F (Air Quality Application Supplement) and Table 2F (Project Emission Increase) provided in Appendix A of this application. As shown on Table 1F, the Project exceeds PSD major source thresholds for VOC and NO<sub>x</sub> emissions as ozone precursors, CO, PM<sub>10</sub>, PM<sub>2.5</sub>, NO<sub>x</sub>, and SO<sub>2</sub>. Therefore, the Project triggers PSD review for non-GHG NSR regulated pollutants.

**Table 2-1 Federal PSD Applicability**

| Air Contaminant Name | Potential to Emit (PTE) Annual Emissions (tpy) | PSD Major Source Threshold (tpy) | PSD Applicable (Yes/No) |
|----------------------|------------------------------------------------|----------------------------------|-------------------------|
| VOC                  | 581.75                                         | 100                              | Yes                     |
| CO                   | 2,140.86                                       | 100                              | Yes                     |
| NO <sub>x</sub>      | 1,591.48                                       | 100                              | Yes                     |
| SO <sub>2</sub>      | 282.28                                         | 100                              | Yes                     |
| PM <sub>10</sub>     | 1,025.80                                       | 100                              | Yes                     |
| PM <sub>2.5</sub>    | 976.69                                         | 100                              | Yes                     |

**Table 2-2** provides a summary of GHG PSD applicability determination. The emissions of CO<sub>2</sub>e exceed the 75,000 tpy significance level for GHG; therefore, the Project is required to obtain a PSD permit for GHG. This application also includes the information necessary for TCEQ review of the GHG PSD permit application.

**Table 2-2 GHG PSD Applicability**

| Air Contaminant Name | Potential to Emit (PTE) Annual Emissions (tpy) | PSD Major Source Threshold (tpy) | PSD Applicable (Yes/No) |
|----------------------|------------------------------------------------|----------------------------------|-------------------------|
| CO <sub>2</sub> e    | 23,584,211.38                                  | 75,000                           | Yes                     |

### **2.3.2 Hazardous Air Pollutants (HAPs)**

Major sources thresholds for hazardous air pollutants (HAPs) are 10 tons or more of any individual HAP, or 25 tons or more of any combination of HAPs. The Project will have the potential to emit (PTE) 10 tons or more of any individual HAP, and 25 tons or more of any combination of HAPs, and therefore this Project is a major source for HAPs.

Project Matador is subject to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Source Categories promulgated under 40 CFR Part 63 (Maximum Achievable Control Technologies [MACT] Standards) as detailed in Section 6 of this application. There are no NESHAPS (40 CFR Part 61) promulgated by the EPA pursuant to Section 112 of the Federal Clean Air Act (FCAA) that apply to this Project, and therefore Project Matador is not subject to FCAA §112(g) permitting.

## **2.4 Public Notice Applicability**

The Project is subject to public notice requirements in accordance with 30 TAC §116.131 for the new permit application. Fermi America will comply with all public notification requirements in accordance with 30 TAC Chapter 39.

## **2.5 Professional Engineer's Certification**

The estimated capital costs associated with the Project are greater than \$2,000,000. Therefore, a professional engineer's certification is included in Appendix E.

## **2.6 Permit Fee**

The permit fee for this Project is \$75,000. The *Form PI-1 General Application* does not include the total estimated capital costs, and the capital costs associated with the Project are greater than \$2,000,000. Therefore, pursuant to 30 TAC §116.141(d), a fee of \$75,000 is being submitted if no estimate of capital project cost is included with a permit application. The permit fee has been paid online through the TCEQ ePay system during the online submission via the State of Texas Environmental Electronic Reporting System (STEERS) for E-Permitting.

## **2.7 Request for Expedited Processing**

Pursuant to 30 TAC §§101.600 – 602, Fermi America respectfully requests expedited processing of this permit application. The Project represents a significant capital investment through the development of next-generation data and AI infrastructure while also fulfilling regional economic development and job creation imperatives. Furthermore, Fermi America's role in enabling advanced data modeling, AI learning platforms, and national security-related compute capabilities aligns with federal Executive Orders (EO) calling for AI ecosystem reliability, clean

infrastructure buildout, and strategic grid modernization (e.g., EO 14017 and EO 14110). As required, a completed Form APD-EXP Expedited Permit Request, Form APD-APS Air Permitting Surcharge Payment Form, and payment in the amount of \$20,000 for the expedited surcharge fee is included with this request.

## Section 3

# Process Description

---

With this application, Fermi America proposes to construct and operate a new natural gas-fired power plant consisting of CCCT generators. The CCCT generators will produce electricity to power an on-property hyperscale data center campus. The electricity produced will be used exclusively on-site for the high-performance data center and will not be sold to the local utility power grid.

The Project will consist of the installation of fifteen (15) 6-on-1 combined cycle combustion turbine (CCCT) generator configurations. Each 6-on-1 CCCT will be equipped with six heat HRSGs. The HRSGs will not have supplemental duct burners. In the 6-on-1 configuration, steam from the six (6) HRSGs will serve a single steam turbine generator. The 15 CCCT configurations will be comprised of 90 Siemens Energy SGT-800 combustion turbines, 15 steam turbines and ancillary equipment arranged in five power blocks. Exhaust gases from each CT will pass through the associated HRSG and an exhaust stack. Therefore, each CCCT will have six associated emission points. The Project's nominal generation capacity will be approximately 6,000 MW. The turbines will be fired exclusively with pipeline quality natural gas.

The Project will consist of the following primary equipment:

- Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines, rated at nominal capability of 56 MW each, and HRSGs equipped with SCR and an oxidation catalyst system for emissions control.

Ancillary equipment and emission sources associated with the Project include:

- Two (2) ULSD-fired engine generators used for black start capability. Each engine is rated at nominal capability of 2,000 kW;
- Six (6) ULSD-fired emergency generator engines (RICE) rated at approximately 4,500 horsepower (HP) each;
- Two (2) ULSD emergency fire suppression system pumps rated at approximately 350 HP each;
- Four (4) ULSD storage tanks with a capacity of 25,000 gallons each;
- Fifteen (15) cooling towers with a cooling spray rate of 100,000 gpm each;
- Combustion lube oil recirculation systems with lube oil vents for each CTG;

- Piping component fugitive emissions from the natural gas system;
- Piping component fugitive emissions from the SCR ammonia system;
- Maintenance activities on the turbines; and
- SF<sub>6</sub> insulated electrical equipment.

Details regarding the equipment to be permitted follow. A process flow diagram (**Figure 3-1**) is included in this section.

### 3.1 Combined Cycle Combustion Turbines

The main components of the CCTGs consist of a compressor, combustor, turbine, HRSG, and electric generators. Filtered ambient air is drawn into the compressor section of the CTG. During periods of warm to hot ambient temperatures, the temperature of the inlet air to the CTG may be lowered by using dry air inlet coolers to increase the mass air flow through the turbine and maintain turbine power output. There are no air emissions associated with the dry inlet air coolers. The plant will also install water-based cooling towers to cool the heat exchangers.

Natural gas is mixed with the compressed inlet air and combusted in the combustor section of the CTG. Dry low-NO<sub>x</sub> (DLN) combustors are used to reduce the NO<sub>x</sub> emissions generated in the combustion process. Hot exhaust gases then enter the expansion turbine where the gases expand across the turbine, which generates torque that causes rotation of the turbine shaft. The shaft drives the compressor section of the unit and spins a dedicated electric generator, producing electricity.

Each 6-on-1 CCCT will be equipped with six HRSGs that increase the power-generating capability of the units. Since the exhaust gases exiting the turbine blade stages are at temperatures significantly above ambient conditions, they represent additional available energy. The turbine exhaust from each turbine is routed to a HRSG; however, no duct burners will be installed. Steam produced by the HRSGs is expanded through a steam turbine to drive another electro-magnetic generator, creating additional electricity. Exhaust from the steam generator is then sent to a condenser to condense the steam and reduce the water temperature for re-use in the steam cycle.

A conventional SCR system, using a 19-percent solution of aqueous ammonia as the reagent, will be used to control NO<sub>x</sub> emissions from the turbines. The systems will be comprised of aqueous ammonia storage and handling equipment, ammonia injection grids, and catalysts beds.

The combined cycle turbines will be equipped with an oxidation catalyst system to minimize CO and organic HAP emissions. The oxidation catalyst system will be comprised of catalyst bed modules and will be installed at the location where exhaust temperatures will optimize CO reduction reactions.

### **3.2 CTG Startup and Shutdown Activities**

Startup and Shutdown (SUSD) of the combined cycle combustion turbines will be part of the planned operations of the Project. For the turbines, Fermi America proposes to use the following language for the startup and shutdown definitions:

- A planned startup is defined as the period starting with first combustion of fuel and ending when the combustion turbine output reaches minimum emissions compliant load (MECL) and compliance with the routine emission limits is achieved, which can vary based on ambient conditions. A planned startup shall not exceed 60 minutes.
- A planned shutdown is defined as the period from MECL to flame out. A planned shutdown shall not exceed 60 minutes.

During planned SUSD periods, emissions may be released from the combustion turbines at higher rates than during normal operations. During startup, higher NO<sub>x</sub> and CO emissions may be produced when the turbines are outside the temperatures and performance mode where the catalytic control systems can be used. Additionally, higher CO and VOC emissions during SUSD may result due to less complete combustion as the CTG transitions to its normal operating mode. As such, this application includes proposed SUSD emissions rates for NO<sub>x</sub>, CO, and VOC emissions from the CTG sources.

To ensure operational independence, the Project will incorporate black-start capability, enabled by two black start engine generators. In a black-start and initial plant startup scenario, the black start generators will be activated to feed power to the first CTG, which ramps up to the MECL sufficient for startup of next CTG in sequence. This sequence is repeated until all units are online and operating in normal mode.

### **3.3 Black Start Generators**

The Project will include two (2) black start generators that will be used for supplemental power generation, as needed, and to support the CTG startup activities. The engine generators will be fired exclusively with ULSD. The supplemental generators are rated at a nominal capability of 2.0 kW of electrical power, each certified to EPA Tier 3 emission standards, and the annual emissions are based on approximately 100 hours per year for black start capability.

### **3.4 Emergency Engines**

The Project will include six (6) ULSD emergency generator engines to provide electric power during emergencies. The emergency generator sets have a standby rating of 3,300 kW (4,500 HP), each certified to EPA Tier 3 emission standards. The engines will be operated for a maximum of 100 hours per year per engine for non-emergency purposes, including maintenance and readiness testing.

The Project will include two (2) ULSD engine-driven emergency fire suppression system pumps to provide fire protection for the plant. The fire system pump engines have a standby rating of 227 kW (350 HP), each certified to EPA Tier 3 emission standards. The engines will be operated for a maximum of 100 hours per year per engine for maintenance and readiness testing.

### **3.5 ULSD Storage Tanks**

The Project will include four (4) ULSD storage tanks with a capacity of 25,000 gallons each to store ULSD fuel for black start generators, emergency generator engines and fire suppression system pumps.

### **3.6 Cooling Towers**

The Project will utilize fifteen (15) cooling towers for evaporative cooling of the heat exchangers.

- Fifteen (15) units with a cooling spray water rate of 100,000 gallon per minute (gpm) will be used to support the Siemens SGT-800 combustion turbine operations; and

Additionally, dry inlet-air coolers (non-water based) will be used to cool the inlet air of the gas turbine in order to improve the combustion turbine power output and heat rate. There are no emissions associated with the dry inlet air coolers.

### **3.7 Combustion Lube Oil Recirculation System Vents**

The combustion turbines will be equipped with dedicated closed-loop lube oil recirculation systems to lubricate the moving parts. Lubricating oil will be circulated through the turbine's machinery from the oil sump, and the heating of recirculating lube oil in the turbine and generator housings will create oil vapor and oil droplets in the oil reservoir compartments. Emissions of condensed lube oil droplets from the lube oil systems will be exhausted through vapor extraction vents serving the units, and these emissions will be controlled with mist eliminators.

### 3.8 Natural Gas System

Natural gas will be delivered to the site via pipeline, metered, and piped to the CTGs. Fugitive emissions from the natural gas piping components (i.e., valves, flanges) include emissions of methane (CH<sub>4</sub>), ethane (C<sub>2</sub>H<sub>6</sub>), VOC, and carbon dioxide (CO<sub>2</sub>) due to potential equipment leaks.

### 3.9 Ammonia SCR Delivery System

Aqueous ammonia at a concentration of 19-percent will be stored in pressurized tanks that will be designed to maintain sufficient pressure to prevent a loss of ammonia to the atmosphere during normal operations. The system may be equipped with pressure relief valves for safety reasons to prevent an over-pressure condition. Aqueous ammonia will be delivered by tanker truck to the pressurized tanks. During filling of the tank, ammonia vapors will be returned to the tanker truck as the storage tank is filled. Piping and fittings associated with the tank and other components of the system delivering ammonia to the SCR system will be sources of fugitive emissions.

### 3.10 Maintenance Activities

Fermi America may perform the following planned maintenance activities on the turbines, which are inherently low emitting (ILE) activities that may generate fugitive emissions:

- Air intake filter maintenance;
- Continuous emissions monitoring system (CEMS) calibrations;
- Inspection, repair, replacement, adjusting, testing, and calibration of analytical equipment and process instrumentation including site glasses, meters, gauges;
- Management of sludge;
- Small equipment maintenance – low vapor pressure VOC;
- Small equipment maintenance – ammonia;
- Online and offline turbine washing; and
- Gaseous fuel venting during turbine shutdown/maintenance and small equipment and fugitive component repair/replacement.

Emissions from the planned ILE maintenance activities associated with equipment are identified as EPN: MSSFUG. Fermi America may also perform combustion turbine optimization, tuning and testing; and online turbine washing, which are planned maintenance activities that release emissions from the CTG stacks. Maximum hourly and total annual emissions associated with combustion turbine optimization, tuning and testing; and online

turbine washing are no higher than the emission rates requested in this application for normal or planned SUSD operations, and are already included in the MAER estimated for the combined cycle combustion turbines.

### **3.11 Sulfur Hexafluoride Insulated Equipment**

Certain electrical equipment such as generator circuit breakers and high voltage breakers associated with the units will be insulated with sulfur hexafluoride (SF<sub>6</sub>). Sulfur hexafluoride (SF<sub>6</sub>) is a colorless, odorless, non-flammable gas. It is a synthetic fluorinated compound that has an extremely stable molecular structure. The unique chemical properties of SF<sub>6</sub> make it an efficient electrical insulator. The gas is used for electrical insulation, arc quenching, and current interruption in high-voltage electrical equipment. Sulfur hexafluoride (SF<sub>6</sub>) is only used in sealed and safe systems, which under normal circumstances do not leak gas. The circuit breakers associated with the units are estimated to contain 162,500 pounds of SF<sub>6</sub>. The circuit breakers will have a low-pressure alarm and a low-pressure lockout. The alarm will alert operating personnel of any leakage in the system and the lockout prevents any operation of the breaker in the event there is a lack of “quenching and cooling” SF<sub>6</sub> gas.

### **3.12 Project Construction and Commissioning**

The Project will be constructed in phases to support the start-up and growth of the data center campus. Construction and commissioning activities for the power generation facilities will occur in phases over several years. The Project development plan targets commissioning the plant in five (5) power blocks approximately every twelve months, which will be dependent on the availability and delivery of the CTGs. Fermi America will comply with the required notifications related to reporting on construction progress in accordance with 30 TAC § 116.115(b)(2)(A), start-up notification requirements for the commencement of operations for each unit of phased construction, which may involve units commencing operations at different times in accordance with 30 TAC §116.115(b)(2)(B), and the regulatory requirements for continuous construction in accordance with 30 TAC §116.120(a).

Commissioning activities will include combustion shakedown and initial operational and contractual testing and tuning to ensure the safe, efficient, and reliable operation of the electric generating facilities. Shakedown is the period beginning with initial CTG startup and ending no later than initial performance testing to ensure the performance specifications and concentration limits of the Project are met. The one-time commissioning and shakedown period for each CTG will not exceed the time period for performance testing as specified in 40 CFR § 60.8. The proposed performance specifications, concentration limits, and emission rate limits do not apply to commissioning activities during which initial operational and contractual testing, tuning, boil-out, shakedown, and other activities may occur during this one-time period.

## Section 4

# Basis for Emission Calculations

---

This section presents the basis and emission calculation methodology for the sources to be authorized in this permit application. Detailed calculations are provided in Appendix B of this application. The TCEQ Form PI-1 General Application is included with this application, which provides the maximum hourly and annual emission rates in pounds per hour (lb/hr) and tons per year (tpy), respectively, in the Unit Types – Emission Rates section.

### 4.1 Combustion Turbines (EPNs: HRGSA-1 through HRSGE-18)

The Project equipment to be permitted will include:

- Fifteen (15) 6-on-1 CCCT generator configurations with Siemens Energy SGT-800 combustion turbines, rated at nominal capability of 56 MW each, and HRSGs equipped with SCR and an oxidation catalyst system for emissions control (EPNs HRGSA-1 through HRSGE-18).

The combined-cycle CTGs will be fired with pipeline-quality natural gas. Products of combustion from the CTGs will include NO<sub>x</sub>, CO, VOC, SO<sub>2</sub>, PM (which includes PM<sub>10</sub> and PM<sub>2.5</sub>), and sulfuric acid mist (H<sub>2</sub>SO<sub>4</sub>). The CTGs will also emit NH<sub>3</sub> as a result of the SCR technology used to control NO<sub>x</sub> emissions to meet Best Available Control Technology (BACT) requirements. NH<sub>3</sub> from the SCR systems will react with H<sub>2</sub>SO<sub>4</sub> to form ammonium sulfate [(NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>] particulates (PM) in the SCR and catalyst bed. The CTGs' combustion emissions will vent to the atmosphere via the CTG exhaust stacks.

This application presents maximum emissions that were calculated using data provided by Siemens Energy and application of BACT.

For all CTGs, maximum short-term emissions during periods other than SUSD (including during periods of full and reduced load operations) were calculated at various ambient conditions and load scenarios for each turbine OEM. Additionally, maximum annual emissions due to the combined contributions from all modes of operation were calculated based on maximum emission rates estimated for normal and SUSD operations and the frequencies of SUSD operations.

The following is a summary of emissions performance assumptions used in calculating the maximum mass emission rates associated with normal operation of the turbines:

- The CTGs will be equipped with DLN combustors and SCR to achieve controlled emissions of NO<sub>x</sub> to 2.0 parts per million by volume, dry basis (ppmvd) at 15% O<sub>2</sub>, calculated on a 24-hour basis. This low NO<sub>x</sub> emission limit can be achieved at an ammonia slip level of 5.0 ppmvd at 15% O<sub>2</sub> (annual average) and the hourly ammonia slip level is 10.0 ppmvd at 15% O<sub>2</sub>.
- Each turbine will be equipped with an oxidation catalyst to limit emissions of organic pollutants. VOC will be limited to concentrations of 2.0 ppmvd at 15% O<sub>2</sub> (as methane), calculated on a three-hour basis, as provided by the vendor.
- NH<sub>3</sub> slip from the SCR system will be limited to short-term concentrations of 10 ppmvd at 15% O<sub>2</sub>, calculated on a three-hour basis, and 5 ppmvd at 15% O<sub>2</sub> on an annual basis, as provided by the vendor.
- CO will be limited to concentrations of 4.0 ppmvd at 15% O<sub>2</sub>, calculated on a three-hour basis and an oxidation catalyst will be used for emissions control.
- Natural gas fuel sulfur content will be limited to 0.5 grains per 100 standard cubic foot (scf), which will limit turbine emissions of SO<sub>2</sub>, H<sub>2</sub>SO<sub>4</sub>, and particulate matter (PM, PM<sub>10</sub> and PM<sub>2.5</sub>).
- The PM, PM<sub>10</sub> and PM<sub>2.5</sub> emissions are based on vendor provided emission rates, which include both the front half and back half formation (filterable and condensable) as well as a secondary formation of ammonium sulfate (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>.
- H<sub>2</sub>SO<sub>4</sub> emissions were calculated using a vendor-provided estimate of a 10% molar conversion ratio of SO<sub>2</sub> to SO<sub>3</sub>- in the SCR and catalyst bed, based on data provided by vendor and conservatively assuming each SO<sub>3</sub>- molecule forms one H<sub>2</sub>SO<sub>4</sub> molecule. Additionally, it was assumed each SO<sub>3</sub>- molecule may form 1 ammonium sulfate (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> molecule, which is a particulate. This was added to the PM emission factor from the vendor for a conservative estimate of total particulate emissions.
- Formaldehyde emissions were calculated based on an outlet stack concentration of 91 parts per billion by volume, dry basis (ppbvd) at 15% O<sub>2</sub>, as required by 40 CFR Part 63 Subpart YYY Table 1.
- The VOC speciated emissions were calculated based on AP-42 Section 3.1, Stationary Gas Turbines (April 2000).

The maximum hourly emissions were calculated based on the maximum heat input rating of turbines, and annual emissions were based on 8,760 annual operating hours. Siemens SGT-800 CTG performance data and emissions at various steady state loads, ambient temperatures, and operating conditions are provided in **Appendix B-1**. The calculation of planned SUSD emissions from the CCCTs is shown in **Appendix B-2** and **B-3**.

For the worst-case hourly emissions, including SUSD emissions, the startup and shutdown times were used to calculate the remaining time in a one-hour period where normal operating emissions could occur. Normal operating emissions were then pro-rated for this period and added to the SUSD to calculate a worst-case hour. Annual emissions resulting from SUSD operations were added to the normal annual operating emissions to calculate the total PTE.

EPA Greenhouse Gas Reporting Program (GHGRP) emission factors were used to calculate emissions of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O using the maximum hourly firing rate and annual operating hours. CO<sub>2</sub> emissions from the natural gas-fired turbines are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for natural gas from Table C-1 to Subpart C of Part 98 of the EPA's Mandatory GHG Reporting Rules. CH<sub>4</sub> and N<sub>2</sub>O emissions from the turbines are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for natural gas from Table C-2 of the Mandatory GHG Reporting Rules. The global warming potential (GWP) factors used to calculate CO<sub>2</sub>e emissions are based on 40 CFR Part 98, Table 2, GHGs with Revised GWPs for Table A-1 (EPA 2013 Revisions to the GHG Reporting Rule).

GHG emission calculations for the CTGs, and the GHG emissions summary for all GHG sources is provided in **Appendix B-12**.

## **4.2 Black Start Engines (EPNs: ENGINE-1 and ENGINE-2)**

The Project will include two (2) ULSD-fired black start engine generators rated at a nominal capability of 2.0 kW (2,682 HP) each. Emission calculations were performed for NO<sub>x</sub>, CO, VOC, SO<sub>2</sub>, PM, PM<sub>10</sub>, PM<sub>2.5</sub>, and GHG emissions associated with these engines. The maximum hourly emission rates are based on the proposed maximum rated power of the engines. The emissions of VOC, NO<sub>x</sub>, PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions are calculated using EPA Tier 2 emissions factors. SO<sub>2</sub> emission calculations were based on the maximum hourly fuel usage rate (in gallons per hour) using ULSD fuel oil at no greater than 0.0015% sulfur by weight (or 15 ppm). Annual emissions were calculated based on the maximum heat input and estimated annual operating hours. Emission calculations for the supplemental generators (EPNs: ENGINE-1 and ENGINE-2) are provided in **Appendix B-4**.

EPA GHGRP emission factors are used to calculate emissions of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O using the maximum hourly heat input and annual operating hours. CO<sub>2</sub> emission calculations are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for Distillate Fuel Oil No. 2 from Table C-1 to Subpart C of Part 98 of the Mandatory GHG Reporting Rules. CH<sub>4</sub> and N<sub>2</sub>O emissions from the ULSD-fired engine are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for petroleum from Table C-2 of the Mandatory GHG Reporting Rules. The GWP factors used to calculate CO<sub>2</sub>e emissions are based on Table A-1 of

the Mandatory GHG Reporting Rules. GHG emission calculations for the supplemental generators are provided in **Appendix B-12**.

#### **4.3 Emergency Engines (EPNs: FPUMP1 – FPUMP2, and EGEN1 – EGEN6)**

Reciprocating internal combustion engines (RICE) are used to pump water during emergency fires and provide emergency power. The proposed Project will include six (15) emergency generators rated at approximately 4,500 HP each, and two (2) fire suppression system pumps rated at approximately 350 HP each. Emission calculations were performed for NO<sub>x</sub>, CO, VOC, SO<sub>2</sub>, PM, PM<sub>10</sub>, PM<sub>2.5</sub>, and GHG emissions associated with these engines. The maximum hourly emission rates are based on the proposed maximum rated power of the engines. The NO<sub>x</sub>, CO, VOC, PM, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions were based on EPA Tier 2 standards for the emergency generator and Tier 3 standards for the fire system pumps. The engines will be fueled by ULSD fuel. For the fire pump engine SO<sub>2</sub> emission estimate, calculations were based on the maximum hourly fuel usage rate (in gallons per hour) using ULSD fuel oil at no greater than 0.0015% sulfur by weight (or 15 ppm). For PM emissions it was assumed that all PM emissions are equal to or less than PM<sub>2.5</sub>. Annual emissions were calculated based on the maximum heat input and annual operating hours, which are 100 hours per year of non-emergency use. Emission calculations for the emergency generator engines (EPNs: EGEN1 – EGEN6) and fire suppression system pumps ((EPNs: FPUMP1 – FPUMP2) are provided in **Appendix B-5**.

EPA GHGRP emission factors are used to calculate emissions of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O using the maximum hourly heat input and annual operating hours. CO<sub>2</sub> emission calculations are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for Distillate Fuel Oil No. 2 from Table C-1 to Subpart C of Part 98 of the Mandatory GHG Reporting Rules. CH<sub>4</sub> and N<sub>2</sub>O emissions from the ULSD-fired engine are calculated using the emission factors (kg/MMBtu converted to lb/MMBtu) for petroleum from Table C-2 of the Mandatory GHG Reporting Rules. The GWP factors used to calculate CO<sub>2</sub>e emissions are based on Table A-1 of the Mandatory GHG Reporting Rules. GHG emission calculations for the emergency generator engines and fire suppression system pumps are provided in **Appendix B-12**.

#### **4.4 Cooling Towers (EPNs: CT-1 through CT-15)**

The estimated PM emissions from the cooling towers are based on the methodology described in AP-42, Section 13.4 except that a 0.001-percent liquid drift rate was used, in accordance with BACT, as the liquid drift factor. The density of water, cooling water circulation rate, and percent liquid drift rate are used to estimate the mass of water drifting to the atmosphere. The mass of water is multiplied by the total dissolved solids (TDS) to estimate PM emissions. As the water utilized for cooling is derived from municipal water supplies, the TDS utilized represents a conservative estimate of the maximum. The maximum hourly and annual emissions are based

on the maximum cooling water circulation rate and the estimated TDS, and an operating schedule of 8,760 hour per year.

The PM<sub>10</sub> and PM<sub>2.5</sub> subset of particulate emissions from the cooling towers, which are analogous to cooling towers, were calculated using the methodology presented in the paper by Reisman and Frisbie; “Calculating Realistic PM<sub>10</sub> Emissions from Cooling Towers.” The PM size distribution in this paper is adjusted for the 3,000 parts per million (ppm) TDS, to obtain the percent of the mass emissions that are equal to or smaller than PM<sub>10</sub>, and the percent of the mass emissions that are equal to or smaller than PM<sub>2.5</sub>. The mass fraction of PM<sub>10</sub> and PM<sub>2.5</sub> emissions is then applied to the PM emission rates to estimate PM<sub>10</sub> and PM<sub>2.5</sub> emissions. As heat exchangers cooled by the wet surface air coolers do not contain VOCs, there is no VOC leakage into the coolers. Detailed emission calculations for the cooling towers (EPNs: CT-1 through CT-15) and the solid particulate size distributions are provided in **Appendix B-6**.

#### **4.5 Lube Oil Recirculation System Vents (EPNs: LVO1 through LVO90)**

The CCCTs will be equipped with dedicated closed-loop lubrication systems. Lubricating oil will be circulated through the turbines’ machinery from the oil sump, and the heating of recirculating lube oil in the turbine and generator housings will create oil vapor and oil droplets in the oil reservoir compartments. Emissions of the droplets will be controlled by a mist eliminator. The calculation of emissions from the lube oil vents is based on loss rate of lube oil in gas turbine reservoirs of 0.2 gallon per day of oil per turbine. Per engineering estimates, 30-percent of these losses are due to loss through the vent, while the remainder are losses to leaks or other non-volatile losses. The calculated hourly emissions are based on the daily emission rate divided by 24 hours per day. Emission calculations from the lube oil vents (EPNs: LVO1 through LVO90) are provided in **Appendix B-7**.

Lube oil mist will be generated, and the corresponding mist eliminator fan will be operated concurrently with turbine operation, including during startup and shutdown, plus additional time after turbine operation. When the gas turbine does not operate for extended periods such that lube oil is cooled to near-ambient temperatures, mist eliminators may be shut down. During this time, vapor breathing and filling losses may occur from each oil reservoir. These latter losses are significantly less than the emission rates calculated in **Appendix B-7**.

#### **4.6 Natural Gas System Fugitive Emissions (EPN: NGFUG)**

Fugitive emissions will be generated from the natural gas feed system (EPN: NGFUG). Natural gas piping component equipment leak fugitive emissions were calculated using estimated component counts and emission factors from EPA-453/R-95-017, November 1995, Table 2-4, Oil and Gas Operation Average Emission Factors. The component counts and average composition

were conservatively estimated from process flow diagrams and engineering counts. Speciation was calculated based on fuel gas analysis. Emissions from fugitive components are included in **Appendix B-8**.

#### **4.7 Ammonia SCR Delivery System Fugitive Emissions (EPN: NH3FUG)**

Piping and fittings associated with the storage tanks and other components of the system delivering ammonia to the SCR systems will be sources of fugitive emissions (EPN: NH3FUG). Equipment leak fugitive emissions from equipment components were calculated using estimated component counts and emission factors for Synthetic Organic Chemical Manufacturing Industry (SOCMI) without (w/o) ethylene factors from Air Permit Technical Guidance for Chemical Sources: Fugitive Guidance (APDG 6422), dated June 2018. Component counts and average composition calculated from process flow diagrams and engineering counts. Emissions from fugitive components are included in **Appendix B-9**.

#### **4.8 ULSD Tanks (EPNs: TNK-DSL1 through TNK-DSL4)**

Four (4) 25,000-gallon storage tanks will be used to store ULSD fuel for the emergency generators and fire suppression system pumps at the plant. Emissions from fixed roof storage tanks were calculated using the methodology described in AP-42, Chapter 7.1 – Organic Liquid Storage Tanks (October 2024). Short-term emission rates are calculated using the TCEQ guidance document; Air Permit Reviewer Reference Guide, APDG 6250v3, released 02/20; "Estimating Short Term Emission Rates from Fixed Roof Tanks". Emissions from the fixed roof tanks are uncontrolled. Emissions from fixed roof tanks, a summary of tank parameters, and a sample calculation are provided in **Appendices B-10a, B-10b, and B-10c**.

#### **4.9 Electrical Equipment Insulated with SF6 (EPN: FUG-SF6)**

Sulfur hexafluoride (SF<sub>6</sub>) emissions from the circuit breakers associated with the proposed CTG units were calculated using a predicted SF<sub>6</sub> annual leak rate of 1.0-percent by weight. The GWP factors used to calculate CO<sub>2</sub>e emissions are based on Table A-1 of the EPA Mandatory GHG Reporting Rules. Fugitive emissions of SF<sub>6</sub> are designated as EPN FUG-SF6. Emission calculations from the circuit breakers are provided in **Appendix B-11**. GHG emission calculations for the turbines, and the GHG emissions summary for all GHG sources are provided in **Appendix B-12**.

#### **4.10 Maintenance Activities (EPN: MSSFUG)**

This section provides a broad description of the emission calculation methodologies used to calculate the estimated ILE emissions. A summary of these emissions is provided in **Appendix B-13** and specific calculations for these activities are found in **Appendix B-13a through B-13i**.

The emission calculation methodologies approved by the TCEQ for the Electric Utility Maintenance Startup and Shutdown (MSS) Workgroup for ILE sources and activities were utilized in this application. The basis of the emission estimates provided (such as the typical number of activities and average emissions per activity) are not intended to be a representation under 30 TAC 116.116(e) but are the best estimate of actual maintenance activities experienced historically. Several of the categories are compilations of many MSS activities performed which may have slight variations in procedure or equipment configuration. These emission calculations are based on worst-case assumptions, actual operation practices and procedures, process knowledge and engineering estimates. Therefore, the calculation basis for each category of MSS emissions should not be considered a 30 TAC 116.116(e) representation, which limits the number of specific MSS activities in a category or the amount of emissions from any individual MSS activity. Instead, these are provided as a reasonable basis for emission estimates which is expected to become an annual emission limit for the permit Maximum Allowable Emission Rate Table (MAERT).

Emission rates are calculated based on scientific principles (such as the ideal gas law), process knowledge, AP-42 factors, TCEQ guidance, or a combination of these. Any representations in the emission calculations concerning individual emission categories are not intended to be interpreted as individual emission rate limitations but rather as an example of the emission calculation approach for the total category emission estimate.

## Section 5

# Best Available Control Technology (BACT)

---

TCEQ regulations require new or modified stationary sources to apply BACT for the control of air contaminants emitted from the project. As stated in 30 TAC §116.111 (a)(2)(C), any new or modified facility must utilize the BACT, with consideration given to the technical practicability and economic reasonableness of reducing or eliminating the emissions from the facility.

The BACT analysis for this Project has been prepared in accordance with TCEQ's three-tier approach and guidance provided in the TCEQ's April 2001 document, *Evaluating Best Available Control Technology (BACT) in Air Permit Applications* (Draft RG-383). According to TCEQ guidance, the BACT process begins at the Tier I (i.e., emission performance levels accepted as BACT in recent permit reviews for the same process and/or industry) and continues sequentially through the Tiers II and III only if BACT cannot be established through a Tier I analysis.

The EPA has accepted TCEQ's three-tier approach to BACT as equivalent to the EPA's top-down approach to BACT for PSD review in most cases when the following are considered:

- Recently issued/approved permits within the state of Texas,
- Recently issued/approved permits in other states, and
- Control technologies contained within the EPA's RACT/BACT/LAER Clearinghouse (RBLC) database.

As stated in the TCEQ's RG-383 BACT guidance, "Tier I of the BACT evaluation involves a comparison of the applicant's BACT proposal to emission reduction performance levels accepted as BACT in recent permit reviews". RG-383 further indicates that the BACT review is complete if the Air Permits Division has not identified emission reduction options with better performance that should be evaluated. As will be presented in the following sections, BACT for the facilities associated with the Project is established at the Tier I level.

BACT applies to all facilities in the Project. PSD pollutants evaluated include emissions of nitrogen oxides (NO<sub>x</sub>), carbon monoxide (CO), particulate matter less than 10 microns (PM<sub>10</sub>), particulate matter less than 2.5 microns (PM<sub>2.5</sub>), sulfur dioxide (SO<sub>2</sub>), volatile organic compounds (VOC), and greenhouse gases (GHGs), represented as carbon dioxide equivalents (CO<sub>2</sub>e). Additionally, this analysis includes a BACT evaluation for sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) and ammonia (NH<sub>3</sub>), where applicable.

Fermi America is proposing that all facilities will meet Tier I BACT, as published by TCEQ. A discussion of BACT and how Fermi America proposes to meet those requirements are included on the TCEQ *Form PI-1 General Application* included with this permit application, as well as in this Section.

## 5.1 Combined Cycle Combustion Turbines

The BACT determinations for the operation of the CCCTs are based on the latest information available from the TCEQ and EPA concerning the evaluation of BACT in permit applications for combined cycle combustion turbine units. Additional relevant documentation that provided technical background information for the BACT assessment of the CCCTs included the TCEQ's *Issued and Pending Air Permits for Gas Turbines with Electric Output Rated 20 MW or Greater* permit list (updated June 2025) and TCEQ's *Current Tier I BACT Requirements: Combustion Sources* spreadsheet (June 4, 2019).

The BACT-based emission rates proposed for the CCCTs are consistent with the published TCEQ recommendations.

### NO<sub>x</sub> BACT Analysis for Combined Cycle Combustion Turbines

NO<sub>x</sub> is formed during combustion by the following three mechanisms:

- **Thermal NO<sub>x</sub>:** Thermal NO<sub>x</sub> results from the dissociation of nitrogen (N<sub>2</sub>) and oxygen (O<sub>2</sub>) molecules in the combustion air at high temperature. The nitrogen and oxygen atoms recombine to form nitric oxide (NO) and nitrogen dioxide (NO<sub>2</sub>). As the combustion temperature increases, thermal NO<sub>x</sub> formation increases exponentially. Thermal NO<sub>x</sub> represents the predominant mechanism for NO<sub>x</sub> formation during operation of a natural gas-fired gas turbine.
- **Prompt NO<sub>x</sub>:** Prompt NO<sub>x</sub> is formed within the flame by reactions of N<sub>2</sub> molecules in the combustion air and hydrocarbon **radicals** from the fuel. The amount of prompt NO<sub>x</sub> formation in a turbine is negligible compared to the amount of thermal NO<sub>x</sub> formed.
- **Fuel NO<sub>x</sub>:** Fuel NO<sub>x</sub> results from the reaction of nitrogen-bound compounds in the fuel with O<sub>2</sub> in the combustion air. Fuel NO<sub>x</sub> formation is largely independent of combustion temperature. The combustion turbines will combust gas that contains little or no nitrogen-bound compounds.

According to the TCEQ Combustion Sources – Current Tier I BACT Requirements spreadsheet, Tier I Best Available Control Technology (BACT) for NO<sub>x</sub> emissions from gas-fired, combined cycle combustion turbines is 2.0 ppmvd at 15% O<sub>2</sub>. These limits are typically achieved with dry low NO<sub>x</sub> burner, water/steam injection, limiting fuel consumption, or SCR. Furthermore, the TCEQ's recent BACT determinations—outlined in the most current Issued Air Permits for Gas

Turbines with Electric Output Rated 20 MW or Greater—indicate that NO<sub>x</sub> limits for similar turbines span from 2.0 to 107.0 ppmvd at 15% O<sub>2</sub>.

A review of the EPA's RACT/BACT/LAER Clearinghouse (RBLC) over the past decade identified 2.0 ppmvd at 15% O<sub>2</sub> is the lowest emissions from the CCCTs. This is achieved by utilizing selective catalytic reduction (SCR) and dry low NO<sub>x</sub> (DLN) combustors.

Fermi America proposes to meet BACT for NO<sub>x</sub> emissions using a combination of DLN combustors, SCR systems and good combustion practices. With these controls in place, NO<sub>x</sub> emissions will not exceed 2.0 ppmvd at 15% O<sub>2</sub> on a 24-hour average basis in steady state operations; excluding maintenance, startup, and shutdown (MSS) periods. This proposed emission rate matches the lowest BACT-based NO<sub>x</sub> limit permitted for comparable combined cycle projects both within Texas and nationwide, thereby satisfying BACT.

### **CO BACT Analysis for Combined Cycle Combustion Turbines**

CO is formed due to the incomplete combustion of natural gas fuel in the combustion chamber. CO is produced when there is insufficient residence time and/or mixing at high temperature to complete the final step in hydrocarbon oxidation, the oxidation of CO to CO<sub>2</sub>.

According to the TCEQ Combustion Sources – Current Tier I BACT Requirements spreadsheet, Tier I Best Available Control Technology (BACT) for CO emissions from gas-fired, combined cycle combustion turbines is 2.0 – 4.0 ppmvd at 15% O<sub>2</sub>. These limits are typically achieved with good combustion practices and/or oxidation catalyst. Furthermore, the TCEQ's recent BACT determinations—outlined in the most current Issued Air Permits for Gas Turbines with Electric Output Rated 20 MW or Greater—indicate that CO limits for similar turbines span from 2.0 to 35.0 ppmvd at 15% O<sub>2</sub>.

A review of the EPA's RBLC over the past decade identified CO concentrations ranging from 0.9 to 25 ppmvd at 15% O<sub>2</sub>. This is achieved by utilizing oxidation catalyst and good combustion practices.

Fermi America proposes to meet BACT for CO emissions using oxidation catalyst and good combustion practices. With these controls in place, CO emissions will not exceed 4.0 ppmvd at 15% O<sub>2</sub> (meets TCEQ Tier I BACT) on a three-hour rolling average basis, in steady state mode excluding startup, shutdown, and maintenance periods.

### **PM<sub>10</sub>/PM<sub>2.5</sub> BACT Analysis for Combined Cycle Combustion Turbines**

Combustion of natural gas in gas turbine generators results in both filterable and condensable particulate matter emissions. Filterable particulate matter is from trace amounts of inert material in the natural gas and any ambient particulates that enter with the turbine air inlet. Condensable particulate emissions are primarily due to the formation of sulfates, nitrates, and possibly organic compounds. The main sources of measured PM emissions are as follows:

- **Formation** of sulfur trioxide (SO<sub>3</sub>) from trace sulfur in the fuel;
- Formation of condensable particulate matter from the incomplete combustion of the **hydrocarbon** constituents of fuel gas;
- **Formation** of ammonium sulfate or ammonium bisulfate from NH<sub>3</sub> in the SCR system and trace sulfur in the fuel; and
- PM in the ambient air that gets past the inlet filtration systems.

According to the TCEQ Combustion Sources – Current Tier I BACT Requirements spreadsheet, Tier I Best Available Control Technology (BACT) for PM<sub>10</sub>/PM<sub>2.5</sub> emissions from gas-fired, combined cycle combustion turbines is “Good combustion practices. Fuel limited to firing pipeline quality natural gas.”

A review of the EPA’s RBLC over the past decade shows good combustion practices and use of clean fuels (NG) as PM<sub>10</sub>/PM<sub>2.5</sub> controls. The most stringent PM<sub>10</sub>/PM<sub>2.5</sub> control method demonstrated for gas turbines is the use of clean burning natural gas. No add-on control technologies are listed in the TCEQ BACT guidelines or EPA RBLC database for natural gas-fired combustion turbines.

Fermi America proposes to meet BACT for PM<sub>10</sub>/PM<sub>2.5</sub> emissions using good combustion practices and use of pipeline quality natural gas.

### **SO<sub>2</sub> BACT Analysis for Combined Cycle Combustion Turbines**

SO<sub>2</sub> emissions from CCCTs result from the oxidation of sulfur in the fuel. The amount of SO<sub>2</sub> in the turbine exhaust is dependent upon the amount of sulfur in the inlet feed stream to the turbines.

According to the TCEQ Combustion Sources – Current Tier I BACT Requirements spreadsheet, Tier I Best Available Control Technology (BACT) for SO<sub>2</sub> emissions from gas-fired, combined cycle combustion turbines is: “Good combustion practices. Fuel limited to firing pipeline quality natural gas (low sulfur fuel). Sulfur content of fuel will not exceed 5 grains per 100 scf on an hourly basis and 1 gr/100 scf on an annual basis.”

A review of the EPA's RBLC over the past decade identified SO<sub>2</sub> concentrations ranging from 0.4 to 5 grains per 100 scf. This is achieved by using good combustion practices and pipeline quality natural gas.

Fermi America proposes to meet BACT for SO<sub>2</sub> emissions using good combustion practices and pipeline quality natural gas. With these controls in place, SO<sub>2</sub> emissions will not exceed 0.5 grains per 100 scf on a 1-hour average basis.

### **VOC BACT Analysis for Combined Cycle Combustion Turbines**

VOCs are formed due to the incomplete combustion of the fuel in the combustion chamber and depend in varying degrees on the extent of fuel mixing, resulting air-to-fuel ratios, combustion temperature, and residence time. The majority of VOCs in the exhaust are due to unburned fuel, although some VOCs are formed as combustion products.

According to the TCEQ Combustion Sources – Current Tier I BACT Requirements spreadsheet, Tier I Best Available Control Technology (BACT) for CO emissions from gas-fired, combined cycle combustion turbines is 2 ppmvd at 15% O<sub>2</sub> if no duct burner, and 4 ppmvd with duct burner, which is achieved through good combustion practices.

A review of the EPA's RBLC over the past decade identified concentrations range from 0.7 to 4 ppmvd at 15% O<sub>2</sub>. This is achieved by utilizing oxidation catalyst and good combustion practices.

Fermi America proposes to meet BACT for VOC emissions using good combustion practices. With these controls in place, VOC emissions will not exceed 2.0 ppmvd at 15% O<sub>2</sub> (meets TCEQ Tier I BACT) on a three-hour rolling average basis, at steady state operations excluding startup, shutdown, and maintenance periods.

### **GHG BACT Analysis for Combined Cycle Combustion Turbines**

GHG emissions from natural gas-fired combustion turbines result from the combustion of natural gas and are directly correlated with the amount of fuel burned. Therefore, the less fuel burned per unit of energy produced, the lower the GHG emissions.

A review of the EPA's RBLC over the past decade identified GHG BACT limits either listed a fuel-based limit of 117 lb CO<sub>2</sub>e/MMBtu; listed a turbine output based limit ranging from 726 – 1,800 lb CO<sub>2</sub>e/MWh; or only listed an annual mass limit of CO<sub>2</sub>e. This is achieved using clean fuels, good combustion practices, and proper operating and maintenance practices.

Fermi America proposes to meet BACT for GHG emissions using clean fuels, efficient operations, good combustion practices, and proper operating and maintenance practices. The proposed GHG BACT limit for CCCTs is 117 lb CO<sub>2</sub>e/MMBtu.

The installation of carbon capture for the control of greenhouse gas emissions is not technically feasible for combined cycle combustion turbines for the following reasons:

Carbon Capture and Sequestration (CCS) is a complex system designed to capture CO<sub>2</sub> emissions from industrial sources, compress and transport it to a storage site, and inject it deep underground for permanent storage. While CCS has been demonstrated in coal-fired power plants and some industrial applications, its integration with natural gas-fired combined-cycle combustion turbines is not technically feasible due to several key challenges. Post-combustion CO<sub>2</sub> capture typically relies on amine solvents to scrub CO<sub>2</sub> from exhaust gases, but natural gas combustion turbines have lower CO<sub>2</sub> concentrations in their exhaust streams compared to coal plants. This makes the use of traditional capture technologies like amine scrubbing less effective and more difficult. Other emerging capture technologies, such as polymeric membranes, are still under development and are unsuitable for the lower CO<sub>2</sub> concentrations present in combustion turbine emissions.

Furthermore, even if CCS technologies were technically feasible, the overall process would still present significant barriers in terms of integration, efficiency, and economic viability. Current CCS systems are energy-intensive and costly, which could severely degrade the operational efficiency of the turbines. The experience with CCS on coal-fired plants, such as the Boundary Dam and Petra Nova projects, has shown that these systems can lead to significant downtime, operational issues, and underperformance. For instance, Petra Nova's CCS system accounted for over 25% of the plant's outage days during its first three years. Beyond the technical challenges of capturing CO<sub>2</sub>, the transport and storage components also pose significant issues. While Texas has infrastructure for CO<sub>2</sub> pipelines, no existing pipelines are in close proximity to the proposed project site, requiring new pipeline infrastructure at a substantial additional cost. Given these challenges, CCS is considered technically infeasible for the combined cycle combustion turbines.

Furthermore, in the proposed rule dated June 17, 2025, 40 CFR Part 60 – Repeal of Greenhouse Gas Emissions Standards for Fossil Fuel-Fired Electric Generating Units, EPA is proposing to repeal CCS-based requirements for new base load combustion turbine EGUs because the EPA is proposing that it has not been adequately demonstrated and the costs are not reasonable. EPA's proposal to repeal the GHG standards explicitly cites broader economic and infrastructure needs and links the potential repeal to supporting the construction of AI data processing centers such as this Project.

### **H<sub>2</sub>SO<sub>4</sub> BACT Analysis for Combined Cycle Combustion Turbines**

H<sub>2</sub>SO<sub>4</sub> emissions from the combustion turbines occur as a result of oxidation of SO<sub>2</sub> to SO<sub>3</sub> as high temperature exhaust gas passes across the surfaces of the SCR and oxidation catalyst. The SO<sub>3</sub> then hydrates to form H<sub>2</sub>SO<sub>4</sub> in the presence of water vapor. Use of clean fuels with low sulfur content and good combustion practices are identified as potentially applicable for controlling H<sub>2</sub>SO<sub>4</sub> emissions from combustion turbines. Both control technologies are feasible for combustion turbines. Therefore, Fermi America proposes the use of clean fuels with low sulfur content and good combustion practices as BACT for H<sub>2</sub>SO<sub>4</sub> from combustion turbines.

### **NH<sub>3</sub> BACT Analysis for Combined Cycle Combustion Turbines**

Fermi America will operate the SCR systems to minimize ammonia slip (i.e., the emission of unreacted ammonia to the atmosphere) while ensuring that the NO<sub>x</sub> emissions limits are met. The ammonia injection systems and associated operating parameters will be carefully controlled to limit ammonia slip in the exhaust streams of combustion turbines to no more than 10.0 ppmvd at 15% O<sub>2</sub> on a rolling 3-hour average and 5.0 ppmvd at 15% O<sub>2</sub> on an annual average basis. This level of emissions control meets with Tier I BACT (7.0 to 10.0 ppmvd at 15% O<sub>2</sub>) as outlined in the TCEQ *Combustion Sources – Current Tier I BACT Requirements* spreadsheet for gas-fired, combined-cycle combustion turbines.

## **5.2 Black Start Generators BACT Analysis**

To meet TCEQ Tier 1 BACT, the black start generators will combust ULSD with no more than 15 parts per million (ppm) sulfur by weight. The engines will include a non-resettable runtime meter and will meet the requirements of 40 CFR 60 Subpart IIII. No visible emissions will leave the property, as determined by a standard of no visible emissions exceeding 30 seconds in duration in any six-minute period as determined using EPA Testing Method 22 or equivalent.

Fermi America proposes use of clean ULSD fuel, limit operating hours, proper engine design and good combustion practices as BACT for all pollutants from black start generators.

## **5.3 Emergency Engines and Fire Suppression System Pumps BACT Analysis**

To meet TCEQ Tier 1 BACT, the emergency generators and fire suppression system pumps will combust ULSD with no more than 15 parts per million (ppm) sulfur by weight. The engines will include a non-resettable runtime meter and will meet the requirements of 40 CFR 60 Subpart IIII. No visible emissions will leave the property, as determined by a standard of no visible emissions exceeding 30 seconds in duration in any six-minute period as determined using EPA Testing Method 22 or equivalent. Non-emergency hours of usage will not exceed 100 hours annually.

Fermi America proposes use of clean ULSD fuel, limit operating hours, proper engine design and good combustion practices as BACT for all pollutants from emergency engines and fire suppression system pumps.

#### **5.4 ULSD Fixed Roof Storage Tanks BACT Analysis**

Four (4) ULSD fixed roof storage tanks will be used to store ULSD fuel for emergency generators and fire suppression system pumps. All these tanks have a true vapor pressure less than 0.5 psia. The fixed roof ULSD storage tanks will have aluminum or white exterior surfaces and will utilize submerged fill. TCEQ Tier I BACT for storage tanks with a capacity less than 25,000 gallons or containing a material with a true vapor pressure of less than 0.5 psia is listed as “fixed roof tank with submerged fill. Uninsulated exterior surfaces exposed to the sun shall be white or aluminum.” Therefore, Fermi America proposes that BACT is satisfied for the ULSD tanks by meeting the Tier I BACT based on the vapor pressure and the capacity of the tank.

#### **5.5 Cooling Towers BACT Analysis**

Particulate matter is formed most commonly from wet or evaporative cooling towers. Typically, warm air passes through the cooling tower and causes the liquid water from the towers to be entrained in the air stream as “drift” droplets. The drift droplets evaporate and produce PM<sub>10</sub> emissions because of the dissolved solids left behind in the droplets. Based on the RBLC review, drift eliminators are the most common PM control option available for wet or evaporative cooling towers. To meet TCEQ Tier 1 BACT, the cooling towers will install drift eliminators to reduce drift losses to less than 0.001-percent.

#### **5.6 Combustion Lube Oil Recirculation System Vents BACT Analysis**

The combined cycle combustion turbines will be equipped with dedicated closed-loop lube oil recirculation systems to lubricate the moving parts. Lubricating oil will be recirculated through the combustion turbines’ machinery from the oil sump, and the heating of recirculating lube oil in the turbine and generator housings will create oil vapor and oil droplets in the oil reservoir compartments. An available control technology to control PM<sub>10</sub>/PM<sub>2.5</sub> and VOC emissions from lube oil vents is to use the mist eliminators. Oil mist eliminators work by capturing and removing fine oil droplets from air or gas streams, typically using a series of filters or coalescing elements. As the mist-laden air passes through the eliminator, small oil droplets coalesce into larger ones, which are then collected and drained away. Therefore, Fermi America proposes use of mist eliminators as BACT for the lube oil vents.

## **5.7 Natural Gas System Fugitives BACT Analysis**

The BACT for fugitives typically involves implementing a Leak Detection and Repair (LDAR) program to minimize VOC and GHG emissions. The current TCEQ's Tier I BACT Requirements spreadsheet states that no control is required if uncontrolled VOC emissions are less than 10 tpy. Since the uncontrolled VOC emissions from the natural gas system fugitives are 0.03 tpy, an LDAR program will not result in any further emissions reduction and will not be implemented as BACT. Therefore, Fermi America proposes to use proper piping design and installation and use of good work practices as BACT to control VOC and GHG emissions from natural gas system fugitives.

## **5.8 Ammonia SCR Delivery System Fugitives BACT Analysis**

To ensure that fugitive emissions from piping components in ammonia service are adequately controlled, Fermi America will implement an Audio, Visual, and Olfactory (AVO) Leak Detection and Repair (LDAR) program for monitoring and control of potential NH<sub>3</sub> fugitive emissions. Pressure relief valves will be installed on the ammonia system for safety purposes and will be monitored in accordance with the AVO program. These relief valves are designed to activate only in the event of an overpressure condition.

The ammonia storage tank will be designed to prevent pressure buildup due to solar heating, ensuring that sunlight alone will not cause the tank pressure to reach the relief valve set point. This inspection and maintenance program will comply with the TCEQ's technical guidance for chemical source equipment leak fugitives, and therefore meets or exceeds the requirements for BACT.

Fermi America proposes BACT for fugitive NH<sub>3</sub> emissions is achieved through maintaining records of all AVO inspections and maintenance activities.

## **5.9 Circuit Breaker Sulfur Hexafluoride (SF<sub>6</sub>) Fugitives BACT Analysis**

An effective control technology for limiting fugitive SF<sub>6</sub> emissions is the use of state-of-the-art circuit breakers with leak detection systems. In comparison to older SF<sub>6</sub> circuit breakers, modern breakers are designed as a totally enclosed-pressure system with far lower potential for SF<sub>6</sub> emissions.

The use of state-of-the-art circuit breakers and leak detection to control the release of SF<sub>6</sub> is considered technically feasible and is inherent to the Project. USEPA also recommends the use of new and/or upgraded equipment, which feature tighter seals and reduced leaks, as well as the use of leak detection to ensure any leaks can be repaired immediately.

Fermi America proposes the use of state-of-the-art circuit breakers with leak detection system as GHG BACT for circuit breakers.

## 5.10 Maintenance Activities Fugitives BACT Analysis

Routine maintenance activities are performed to ensure the proper operability of equipment. The frequency and duration of the identified maintenance activities will be limited such that the calculated emissions will be low enough to be classified as ILE activities. The emissions associated with these ILE maintenance activities are so low that alternative work practices would not result in meaningful emission reductions. The limited duration and frequency of the identified ILE maintenance activities result in insignificant emissions, which satisfies BACT.

## 5.11 BACT Summary

Tables 5-1 and 5-2 present a summary of proposed BACT for the Project emission sources.

**Table 5-1**  
**BACT Summary for Combined Cycle Combustion Turbines**

| Emission Point Number (EPN)                                                                                                                                                                                                                                           | Pollutant                           | BACT Limit                                                                         | Averaging Time            | Control Technology                                                                                                                         |

<sup>[1]</sup>Maximum Allowable Emission Rates (MAER)

## Section 6

# State Regulatory Requirements

---

This section addresses the assurance of regulatory compliance with applicable state and federal air quality regulations. The requirement contained in 30 TAC Chapter 116.111(a)(2)(A)(i), states:

*The emissions from the proposed facility will comply with all rules and regulations of the TCEQ and with the intent of the Texas Clean Air Act (TCAA), including protection of health and physical property of the public.*

As outlined in the following evaluation, the emissions from Project Matador will comply with all rules and regulations of the TCEQ and with the intent of the TCAA, including the protection of the health and welfare, and property of the public.

### Chapter 101 – General Rules

Fermi America will operate in compliance with all requirements of the TCEQ General Rules. Some notable rule compliance procedures are summarized below.

#### §101.2 Multiple Air Contaminant Sources or Properties

Fermi America will demonstrate through air dispersion modeling that the sources to be permitted will not cause or contribute to any violations of ambient air quality standards and will control air emissions in compliance with commission regulations.

#### §101.3 Circumvention

There will be no use of any plan, activity, device or contrivance which will, without resulting in an actual reduction of air contaminants, conceal or appear to minimize the effects of an emission which would otherwise constitute a violation of the TCAA or TCEQ regulations from any source included in this application.

#### §101.4 Nuisance

Fermi America will demonstrate through air dispersion modeling that there will be no emissions of air contaminants or combined emissions in concentration and duration that would or may tend to injure or adversely affect human health or welfare, animal life, vegetation, or property, or interfere with the normal use and enjoyment of animal life, vegetation, or property.

#### **§101.5           Traffic Hazard**

There will be no traffic hazards or interference caused by emissions from the sources included in this application.

#### **§101.8           Sampling**

Upon request of the TCEQ and as directed under the special conditions of the permit, Fermi America will conduct sampling at Project Matador to determine the opacity, rate, composition, or concentration of the stream requested.

#### **§101.9           Sampling Ports**

Fermi America will comply with the applicable requirements related to sampling ports.

#### **§101.10          Emissions Inventory Requirements**

On an annual basis, Project Matador will file the appropriate emissions inventory (EI) of the air pollutants emitted by the site via the STEERS-AEIR Web-EI reporting system, as applicable.

#### **§101.13-19      Administrative Provisions**

Fermi America will adhere to and comply with the applicable requirements of these sections.

#### **§101.20          Compliance with Environmental Protection Agency Standards**

Certain equipment within the Project is subject to the New Source Performance Standards (NSPS) rules and regulations as promulgated under Title 40 Code of Federal Regulations Part 60 (40 CFR Part 60). Additionally, certain equipment within the Project is subject to NESHAP for Source Categories promulgated under 40 CFR Part 63. Fermi America will comply with all applicable requirements, as documented in Section 6, which provides detailed information on the applicable federal regulatory requirements.

The Project will not result in the emissions of any pollutants subject to NESHAP standards as promulgated under 40 CFR Part 61. Additionally, the Project is not subject to 40 CFR Part 82.

#### **§101.21          The National Primary and Secondary Ambient Air Quality Standards (NAAQS)**

Fermi America will comply with all applicable requirements associated with the NAAQS in the AQA and PSD modeling report required as part of this application.

**§101.23          Alternate Emission Reduction ("Bubble") Policy**

Operation of Project Matador will not be regulated by the Alternative Emission Reduction Policy.

**§101.24 and §101.27    Inspection Fees and Emissions Fees**

Fermi America will submit all appropriately assessed fees to the TCEQ for Project Matador each year, as applicable.

**§101.26          Surcharge on Fuel Oil in Specified Boilers**

The provisions of 30 TAC §101.26 do not apply as there are no boilers in the Project.

**§101.28          Stringency Determination for Federal Operating Permits**

This application is not for a federal operating permit; therefore, this section does not apply.

**§101.100-122    Failure to Attain Fee**

The Project is not located in the Houston-Galveston-Brazoria (HGB) ozone nonattainment area; therefore, these sections do not apply.

**§101.150-155    Voluntary Supplemental Leak Detection Program**

The voluntary supplemental leak detection program is applicable to authorized equipment or facilities in VOC service. The Project natural gas piping component fugitives consist of less than 0.5-percent VOC and there is minimal equipment at the site in VOC service. As such, Project does not anticipate participation in this voluntary program.

**§101.201          Emissions Event Reporting and Recordkeeping Requirements**

Fermi America will comply with the applicable reporting and recordkeeping requirements, as described in this section.

**§101.211          Scheduled Maintenance, Startup, and Shutdown Reporting and Recordkeeping Requirements**

Fermi America will comply with the applicable reporting and recordkeeping requirements, as described in this section.

**§101.221-224    Operational Requirements, Demonstrations, Actions to Reduce Excess Emissions, and Temporary Exemptions during Drought Conditions**

Fermi America will comply with the requirements of 30 TAC §§ 101.221 – 101.224, as necessary.

### **§101.231-233 Variances**

Fermi America is not requesting a variance with this application; therefore, these sections do not apply.

### **§101.300-311 Emission Credit Banking and Trading**

This permit action does not result in any VOC or NO<sub>x</sub> emission reductions that will be used for emission credit banking and trading.

### **§101.330-339 Emissions Banking and Trading Allowances**

These sections do not apply because this permit action does not include electric generating facilities permitted under Chapter 116, Subchapter I (relating to Electric Generating Facility Permits).

### **§101.350-363 Mass Emission Cap and Trade Program**

The Project is not located in the HGB ozone nonattainment area; therefore, these sections do not apply.

### **§101.370-379 Discrete Emission Credit Banking and Trading**

Fermi America will not generate or use any discrete emission credits in association with this Project.

### **§101.390-403 Highly-Reactive Volatile Organic Compound Emissions Cap and Trade Program**

The Project is not located in the HGB ozone nonattainment area; therefore, these sections do not apply.

### **§101.501-508 Clean Air Interstate Rule (CAIR)**

This application does not include a stationary, fossil fuel-fired boiler or stationary, fossil fuel-fired combustion turbine meeting the applicability requirements under 40 CFR Part 96, Subpart AA, or Subpart AAA because the generators the proposed units serve will not produce electricity for sale; therefore, these sections do not apply.

### **§101.600-602 Expedited Permitting**

Pursuant to 30 TAC §§101.600 – 101.602, Fermi America respectfully requests Expedited Processing of this application. As required, the complete Forms APD-EXP (Expedited Permitting Request) and APD-APS (Air Permitting Surcharge Payment) are included in Appendix A.

## **Chapter 106 – Permits By Rule**

This application includes all emission sources associated with the Project. There are no Permits by Rule (PBRs) being claimed or registered to authorize activities associated with Project Matador. In the future, if PBR authorizations are required, Fermi America will comply with the requirements of 30 TAC Chapter 106, and will comply with TCEQ requirements for incorporating PBRs into the permit either by consolidation or by reference, as applicable.

## **Chapter 111 – Control of Air Pollution from Visible Emissions and Particulate Matter**

### **§111.111-113 Visible Emissions**

Visible emissions from sources associated with this application are not expected to exceed the opacity limitations specified by these sections. The Chapter 111 opacity limit for the combined cycle CTGs is 20 percent opacity averaged over a six-minute period, and during normal operations, opacity of emissions from the combined cycle CTG stacks authorized by this permit shall not exceed 5 percent averaged over a six-minute period, which is less than the Chapter 111 requirement. During periods of MSS operation of the combined cycle CTGs, the opacity shall not exceed 15 percent averaged over a six-minute period. Fermi America will demonstrate compliance with the opacity limits by conducting visible emission observations at least once during each calendar quarter while the facilities are in operation. Fermi America will comply with all applicable opacity limitations specified in 30 TAC §111.111.

### **§111.121-129 Incineration**

There is no incinerator associated with this application. Therefore, these sections do not apply.

### **§111.131-139 Abrasive Blasting of Water Storage Tanks Performed by Portable Operations**

There is no abrasive blasting of water storage tanks associated with this application; therefore, these sections do not apply.

### **§111.141-149 Materials Handling, Construction, Roads, Streets, Alleys, and Parking Lots**

Project Matador is located in Carson County, which is outside the Geographic Areas described at 30 TAC § 111.141; therefore, sections 111.141 through 111.149 do not apply.

### **§111.151-153 Emissions Limits on Nonagricultural Processes**

The Project will comply with the 30 TAC §111.151 applicable emissions limits and the maximum allowable emissions rates for this Project are significantly less than what is allowable under 30 TAC §111.151. Fermi America will comply with the requirements of these sections.

### **§111.171-175 Emissions Limits on Agricultural Processes**

There are no agricultural processes at Project Matador. Therefore, these sections do not apply.

### **§111.181-183 Exemptions for Portable or Transient Operations**

Project Matador is not a portable or transient operation. Therefore, these sections do not apply.

### **§111.201-221 Outdoor Burning**

Outdoor burning will not be performed at Project Matador. Therefore, these sections do not apply.

## **Chapter 112 – Control of Air Pollution from Sulfur Compounds**

### **§112.1-21 Control of Sulfur Dioxide**

When requested by TCEQ, Fermi America will demonstrate compliance with the reporting and recordkeeping requirements for the applicable SO<sub>2</sub> emission limits specified in 30 TAC §112.2. Fermi America will comply with the provisions of 30 TAC §112.3 and will operate facilities covered by this application such that SO<sub>2</sub> emissions will not cause an exceedance of the net ground level concentration limit allowed by §112.3(a), as will be demonstrated by air dispersion modeling. Fermi America is not seeking an exemption under §112.4; therefore, this rule does not apply.

### **§112.31-34 Control of Hydrogen Sulfide**

Fermi America will comply with the provisions of 30 TAC §112.31 and 30 TAC §112.31 and will operate facilities covered by this application such that H<sub>2</sub>S emissions will not cause an exceedance of the net ground level concentration limit allowed by Chapter 112, Subchapter B as demonstrated by air dispersion modeling. Fermi America will comply with the procedures outlined in §112.33 for calculation of H<sub>2</sub>S emissions for determination of compliance with emission limits.

### **§112.41-47 Control of Sulfuric Acid**

Fermi America will comply with the provisions of 30 TAC §112.41 and will operate facilities covered by this application such that H<sub>2</sub>SO<sub>4</sub> emissions will not cause an exceedance of the net ground level concentration limit allowed by 30 TAC §112.41(a), as demonstrated by air dispersion modeling. Fermi America will comply with the procedures outlined in 30 TAC §112.33 for calculation of H<sub>2</sub>SO<sub>4</sub> emissions for determination of compliance with emission limits.

#### **§112.51-59 Control of Total Reduced Sulfur**

The Project does not include any kraft pulp mills; therefore, these sections related to total reduced sulfur (TRS) do not apply.

#### **§112.100-308 Sulfur Compound Nonattainment Areas**

Chapter 112, Subchapters E, F, and G apply to Howard County, Hutchinson County, and Navarro County nonattainment areas, respectively. Project Matador is not located in these nonattainment areas; therefore, these subchapters do not apply.

### **Chapter 113 – Control of Air Pollution from Toxic Materials**

Chapter 113 incorporates by reference the federal standards of performance for HAPs and for designated facilities and pollutants adopted by EPA. Section 6 of this application demonstrates how Project Matador will comply with the applicable standards. Project Matador is not subject to 40 CFR Part 65, and does not operate a municipal solid waste landfill or hospital /medical/infectious waste incinerators.

### **Chapter 114 – Control of Air Pollution from Motor Vehicles**

This application does not seek authorization for mobile source emissions.

### **Chapter 115 – Control of Air Pollution from Volatile Organic Compounds**

#### **§115.110-119 Storage of Volatile Organic Compounds**

Project Matador is not located in any of the applicable nonattainment areas or covered attainment counties subject to this rule; therefore, these sections do not apply.

#### **§115.120-129 Vent Gas Control**

Project Matador does not operate Synthetic Organic Chemical Manufacturing Industry (SOCMI) facilities covered by the subchapters related to vent gas control. As such, this division does not apply.

#### **§115.131-139 Water Separation**

There is no water separator associated with this permit application; therefore, these regulations do not apply.

**§115.140-149 Industrial Wastewater**

There is no industrial wastewater processing facility associated with this permit application; therefore, these sections do not apply.

**§115.152-159 Municipal Solid Waste Landfills**

Project Matador does not operate any municipal solid waste landfill facilities; therefore, these sections do not apply.

**§115.160-169 Batch Processes**

Project Matador does not operate any batch processes; therefore, these sections do not apply.

**§115.170-183 Oil and Natural Gas Service in Ozone Nonattainment Areas**

Project Matador is not located in any of the applicable ozone nonattainment areas subject to this rule; therefore, these sections do not apply.

**§115.211 Loading and Unloading of VOCs**

Project Matador does not operate a gasoline terminal; therefore, 30 TAC §115.211 does not apply.

**§115.212-219 Loading and Unloading of Volatile Organic Compounds**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.221-229 Filling of Gasoline Storage Vessels (Stage I) for Motor Vehicle Fuel Dispensing Facilities**

There is no motor vehicle fuel dispensing associated with Project Matador; therefore, these sections do not apply.

**§115.234-239 Control of Volatile Organic Compound Leaks from Transport Vessels**

Project Matador is not located in any of the applicable nonattainment areas or covered attainment counties subject to this rule; therefore, these sections do not apply.

**§115.240-248 Control of Vehicle Refueling Emissions (Stage II) at Motor Vehicle Fuel Dispensing Facilities**

There is no motor vehicle fueling dispensing facility at Project Matador; therefore, these sections do not apply.

**§115.252-259 Control of Reid Vapor Pressure of Gasoline**

Project Matador is not located in El Paso County; therefore, these sections do not apply.

**§115.311-319 Process Unit Turnaround and Vacuum-Producing Systems in Petroleum Refineries**

Project Matador is not a petroleum refining process unit; therefore, these sections do not apply.

**§115.322-329 Fugitive Emission Control in Petroleum Refineries in Gregg, Nueces, and Victoria Counties**

Project Matador is not a petroleum refinery; therefore, these sections do not apply.

**§115.352-359 Fugitive Emission Control in Petroleum Refining, Natural Gas/Gasoline Processing, and Petrochemical Processes**

Project Matador is not a petroleum refinery, Natural Gas/Gasoline Processing unit, or Petrochemical Process unit; therefore, these sections do not apply.

**§115.412-419 Degreasing and Cleanup Processes**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.420-429 Surface Coating Processes**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.430-449 Flexographic and Rotogravure Processes and Offset Lithographic Printing**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.450-459 Control Requirements for Surface Coating Processes**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.460-469 Industrial Cleaning Solvents**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.470-479 Miscellaneous Industrial Adhesives**

Project Matador is not located in any of the applicable geographic areas subject to this rule; therefore, these sections do not apply.

**§115.510-539 Cutback Asphalt and Pharmaceutical Manufacturing Facilities**

Project Matador does not operate these types of facilities; therefore, these sections do not apply.

**§115.540-549 Degassing or Cleaning of Stationary, Marine, and Transport Vessels**

Project Matador does not operate these types of facilities; therefore, these sections do not apply.

**§115.552-619 Petroleum Dry Cleaning Systems and Consumer Products**

Project Matador does not operate these types of facilities; therefore, these sections do not apply.

**§115.720-789 Highly-Reactive Volatile Organic Compounds**

Project Matador is not located in the HGB ozone nonattainment area; therefore, these sections do not apply.

**§115.901-916 Alternate Means of Control (AMOC)**

Fermi America is not requesting an AMOC as part of this permit application; therefore, these sections do not apply.

**§115.920-923 Early Reductions**

Fermi America is not requesting an extension to comply with any requirement in Chapter 115; therefore, these sections do not apply.

**§115.930-940 Compliance and Control Plan Requirements**

A schedule for achieving compliance with the applicable sections of this regulation will be provided upon request by the Executive Director.

**§115.950 Emissions Trading**

Emission reduction credits and discrete emission reduction credits will not be used to meet the emission control requirements of this chapter.

## **Chapter 116 – Control of Air Pollution by Permits for New Construction/Modification**

### **§116.110      Applicability**

This application is being submitted in compliance with the requirement to obtain appropriate authorization before commencing construction. The construction permit application is being submitted under seal of Texas licensed professional engineer Fermi America is the owner and operator of Project Matador and is responsible for compliance with the requirements in 30 TAC §116.110.

### **§116.111(a)(1) and (a)(2)(A)      Protection of Public Health and Welfare and Proximity to Schools**

This permit application will satisfy all requirements of 30 TAC §116.111. A completed *PI-1 General Application form* signed by an authorized representative of Fermi America is included in this application. This application includes information demonstrating that the emission rates from the new facilities associated with this Project comply with the rules and regulations of the TCEQ and the intent of the TCAA, including protection of health and property of the public. As indicated on Figure 1-1, there are no schools located within 3,000 feet from Project Matador.

### **§116.111(a)(2)(B)      Measurement of Emissions**

Project Matador will measure the emissions of significant air contaminants in accordance with this permit application. A monitoring plan is included the TCEQ Form PI-1 General Application, which details the requirements to demonstrate compliance through monitoring for each pollutant to be emitted from each source to be authorized. For the combined cycle CTGs in this application, Fermi America will install, calibrate, maintain, and operate a continuous emissions monitoring system (CEMS) to measure and record the concentrations of NO<sub>x</sub>, CO, and diluents (O<sub>2</sub> or carbon dioxide) in the combined cycle CTG stacks. Additionally, continuous monitoring systems will be used to monitor and record the average hourly natural gas consumption of the combined cycle CTGs, and for measurement of the concentrations of NH<sub>3</sub> slip when the combined cycle CTG SCR units are in operation.

### **§116.111(a)(2)(C)      Best Available Control Technology (BACT)**

Project Matador will utilize BACT with consideration given to the technical practicability and economic reasonableness of reducing emissions. A BACT analysis was performed for the Project, which is presented in Section 5 of this application.

### **§116.111(a)(2)(D)      New Source Performance Standards (NSPS)**

Fermi America will comply with the applicable Standards of Performance for New Stationary Sources (NSPS), 40 CFR Part 60 Subparts, as discussed above.

**§116.111(a)(2)(E) National Emission Standards for Hazardous Air Pollutants (NESHAP)**

The emission sources at the site are not subject to any NESHAP as specified in 40 CFR Part 61; therefore, this requirement is not applicable.

**§116.111(a)(2)(F) NESHAP for Source Categories (MACT)**

Fermi America will comply with the requirements of 40 CFR Part 63 NESHAP for Source Categories (MACT Standards), as discussed in Section 6.

**§116.111(2)(G) Performance Demonstration**

Project Matador will achieve the performance specified in this application, which has been determined by equipment vendor guarantees, regulatory prescribed emission factors, and other indicia of reliability in the information used to determine expected emissions performance. Fermi America will measure emissions of regulated air contaminants from the CTGs through emissions performance testing, continuous emissions monitoring, and parameter monitoring. The CTG stacks will be equipped with a CEMS for measuring emissions of NO<sub>x</sub> and CO. Other pollutants will be monitored by measuring the fuel input to the combustion turbine and applying the emission factors used in this application.

Fermi America will operate all process and emissions control equipment according to instructions and recommendations provided by the equipment vendors and in compliance with applicable regulatory requirements and the terms of any TCEQ permit. If requested by the Executive Director, Fermi America will provide additional performance data and testing as appropriate in order to demonstrate further that the Project will achieve the performance specified in the application.

**§116.111(a)(2)(H) Nonattainment Review**

Project Matador is located in Carson County, Texas, which is classified as an attainment or unclassifiable area for all criteria pollutants; therefore, nonattainment review is not required.

**§116.111(a)(2)(I) Prevention of Significant Deterioration (PSD) Review**

PSD review applies for NO<sub>x</sub>, CO, VOC, SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and CO<sub>2e</sub> emissions from the proposed Project, and Fermi America will comply with all applicable requirements in 30 TAC Chapter 116, Subchapter B, Division 6 concerning PSD review.

#### **§116.111(a)(2)(J)      Air Dispersion Modeling**

Fermi America will submit computerized air dispersion modeling to the TCEQ following the TCEQ Air Dispersion Modeling Team (ADMT) review and approval of the PSD Modeling Protocol and Electronic Modeling Evaluation Workbook (EMEW) for Non-SCREEN3 (version 3.0), which are included as Appendix D to this application. The protocol addresses the proposed modeling methodologies that will be used to demonstrate that the air emissions associated with this Project will not cause or contribute to a violation of any applicable NAAQS or PSD Increments, nor cause any adverse human health or welfare effects, and to provide an assessment of the project's effect on the overall environment.

Acceptable air dispersion modeling with a demonstration of compliance with the NAAQS and Increments for NO<sub>2</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> at all receptors will be performed. Additionally, a State Property Line impacts analysis will be performed for all sulfur compounds. A final AQA and modeling report will be submitted after consultation with TCEQ.

#### **§116.111(a)(2)(K)      Hazardous Air Pollutants**

Affected sources subject to this subchapter are those sources for which no MACT standard has been promulgated under 40 CFR Part 63. Project Matador does not have any affected sources that meet these criteria and therefore this section is not applicable.

#### **§116.111(a)(2)(L)      Mass Cap and Trade Allowances**

Project Matador is not located in the HGB ozone nonattainment area; therefore, these sections do not apply.

#### **§116.112      Distance Limitations**

Project Matador is not a lead smelter or concrete crushing facility; therefore, these sections do not apply.

#### **§116.114      Application Review Schedule**

Fermi America will comply with all conditions of the TCEQ permit review schedule.

#### **§116.115      General and Special Conditions**

Fermi America will comply with all conditions and provisions of the TCEQ air permit.

**§116.116      Changes to Facilities**

Project Matador will be operated in accordance with the representations made in this application. Any changes in the construction or operation of the facilities from the representations made in this permit application that result in changes in the method of controlling emissions, the character of the emissions, or an increase in emissions will be proceeded by proper authorization.

**§116.117      Documentation and Notification of Changes to Qualified Facilities**

This section does not apply to this permit application.

**§116.119      De Minimis Facilities or Sources**

No de-minimis facilities or sources are represented in this permit application.

**§116.120      Voiding of Permits**

Once authorized, Fermi America will begin and continue the construction of the Project such that its permits will not become void under this section.

**§116.127      Actual to Projected Actual and Emission Exclusion Test for Emissions**

This section does not apply to this permit application.

**§116.128      Amendment Application, Public Notice and Contested Case Hearing Procedures for Certain Electric Generating Facilities**

This section does not apply to this permit application.

**§116.140-143    Permit Fees**

As detailed in Section 2.6, Fermi America will remit the appropriate permit application fee in accordance with this section. Likewise, as detailed in Section 2.7, Fermi America will remit the air permitting surcharge payment for expedited processing of this permit application.

**§116.150      New Major Source or Major Modification in Ozone Nonattainment Area**

Project Matador is located in Carson County, Texas, which is classified as an attainment or unclassifiable area for all criteria pollutants; therefore, the requirements of this section are not applicable.

**§116.151 New Major Source or Major Modification in Nonattainment Area other than Ozone**

Project Matador is located in Carson County, Texas, which is classified as an attainment area or unclassifiable area for all criteria pollutants; therefore, this section does not apply to this permit application.

**§116.160-163 Prevention of Significant Deterioration Review**

PSD review applies for NO<sub>x</sub>, CO, VOC, SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and CO<sub>2e</sub> emissions from the proposed Project, and Project Matador will comply with all applicable requirements in 30 TAC Chapter 116, Subchapter B, Division 6 concerning PSD review.

**§116.170-176 Emissions Reductions: Offsets**

Emission offsets are not required for this Project.

**§116.178 Portable Facilities**

There are no portable facilities associated with this permit application. Therefore, the requirements of this section do not apply.

**§116.180-198 Plant-wide Applicability Limits**

Fermi America is not requesting plant-wide applicability limits with this application; therefore, these sections do not apply.

**§116.310-315 New Source Review Permit Renewal**

These sections do not apply to this permit application since it is not a renewal application.

**§116.400-406 Hazardous Air Pollutants: Regulations Governing Constructed or Reconstructed Major Sources**

Affected sources subject to this subchapter are those sources for which no MACT standard has been promulgated under 40 CFR Part 63. Project Matador does not have any affected sources that meet these criteria and therefore this section is not applicable.

**§116.601-620 Standard Permits**

This application is not a request for authorization under a Standard Permit; therefore, these sections do not apply to this permit application.

#### **§116.710-765 Flexible Permits**

Project Matador will not operate under a flexible permit and this application is not a request for authorization under a Flexible Permit; therefore, these sections do not apply to this permit application.

#### **§116.770-870 Permits for Grandfathered Facilities**

These sections do not apply to this permit application.

#### **§116.910-931 Electric Generating Facility Permits**

Project Matador is not a grandfathered electric generating facility (EGF); therefore, these sections do not apply.

#### **§116.1010-1070 Multiple Plant Permits**

These sections do not apply to this permit application.

#### **§116.1200 Emergency Orders**

Fermi America will apply for an emergency order in compliance with these rules if a catastrophic event occurs that necessitates such action.

#### **§116.1400-1428 Permits for Specific Designated Facilities**

These sections do not apply to this application.

#### **§116.1500-1540 Best Available Retrofit Technology (BART)**

These sections do not apply to this application.

### **Chapter 117 – Control of Air Pollution from Nitrogen Compounds**

Project Matador is not located in an ozone nonattainment area and is not subject to Chapter 117, Subchapter B (Combustion Control at Major Industrial, Commercial, and Institutional Sources in Ozone Nonattainment Areas), Subchapter C (Combustion Control at Major Utility Electric Generation Sources in Ozone Nonattainment Areas), or Subchapter D (Combustion Control at Minor Sources in Ozone Nonattainment Areas). Project Matador is not located in the covered geographic regions subject to Chapter 117, Subchapter E (Multi-Region Combustion Control) and therefore the sections in Subchapter E do not apply.

Project Matador does not operate any acid manufacturing facilities, and therefore the sections in Subchapter F do not apply to this permit application. Fermi America does not operate any units

subject to Chapter 117 and is not located in the covered geographic regions subject to Chapter 117. As such, Project Matador is not subject to the general monitoring and testing requirements (Subchapter G) and administrative provisions (Subchapter H).

### **Chapter 118 – Control of Air Pollution Episodes**

The Project sources will be operated in compliance with any orders of the Commission relating to generalized and localized air pollution episodes. Fermi America will implement all reasonably available emission reduction methods in the event of a Level I air pollution episode and will comply with the TCEQ directions to reduce or curtail emission rates in the event of a Level II episode as specified in 30 TAC §§118.2 and 118.3, respectively, upon request of the TCEQ.

### **Chapter 122 – Federal Operating Permits**

Fermi America will apply for the appropriate Federal Operating Permit (FOP) authorizations for the Project.

# Section 7

## Federal Regulatory Requirements

---

### 7.1 New Source Performance Standards (NSPS)

The following NSPS rules as promulgated under Title 40 Code of Federal Regulations (40 CFR) Part 60 apply to this Project:

#### **Subpart A – General Provisions**

Project Matador will comply with the general reporting and testing requirements of the General Provisions, where applicable.

#### **Subpart IIII—Standards of Performance for Stationary Compression Ignition Internal Combustion Engines**

NSPS Subpart IIII applies to the emergency generator engines and fire suppression system pumps to be installed as part of this Project. Fermi America will comply with Subpart IIII through the use of engines certified to meet the Subpart IIII emission requirements, proper operation and maintenance of the equipment, and firing of ULSD fuel meeting federal diesel fuel specifications.

#### **Subpart KKKK—Standards of Performance for Stationary Combustion Turbines**

NSPS Subpart KKKK applies to the combustion turbines to be installed as part of this Project. Fermi America will meet the required Subpart KKKK NO<sub>x</sub> limit of 15 ppm @ 15% O<sub>2</sub>. The NO<sub>x</sub> limit is on a 4-hour rolling average for combined cycle units. The fuel burned will not contain potential sulfur in excess of 0.060 lb/MMBtu.

#### **Subpart TTTTa— Standards of Performance for Greenhouse Gas (GHG) Emissions for New Construction and Reconstruction Stationary Combustion Turbine Electric Generating Units**

Fermi America will not be subject to NSPS Subpart TTTTa because the plant will not supply or sell electricity to the power grid. Specifically, the GHG standards included in this subpart apply to turbine(s) that “serves a generator or generators capable of selling greater than 25 MW of electricity to a utility power distribution system [§60.5509a(a)(2)].” The Project’s combustion turbines will not sell electricity to a utility power distribution system and the Project’s power generation solely for on-site use.

See **Table 7-1** for NSPS applicability determination and details of applicable subparts. Fermi America will comply with all applicable requirements in 40 CFR Part 60.

**Table 7-1 40 CFR 60 New Source Performance Standards (NSPS)**

| <b>40 CFR 60 Subpart</b>                                                                                                                                                                                                    | <b>Unit</b>                                                                    | <b>Applies</b> | <b>Basis for Applicability</b>                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Subpart A-General Provisions                                                                                                                                                                                                | All Equipment Subject to a Subpart of 40 CFR 60                                | Yes            | All sources subject to a 40 CFR 60 Subpart are required to meet the general provisions in Subpart A, as applicable.                                                       |
| Subpart KKKK—Standards of Performance for Stationary Combustion Turbines                                                                                                                                                    | HSRGA1-HRSGA18, HSRGB1-HRSGB18, HSRGC1-HRSGC18, HSRGD1-HRSGD18, HSRGE1-HRSGE18 | Yes            | The combustion turbines have a peak heat input of greater than 10 MMBtu/hr.                                                                                               |
| Subpart TTTT—Standards of Performance for Greenhouse Gas Emissions for Electric Generating Units                                                                                                                            | n/a                                                                            | No             | The stationary combustion turbines will not be connected to the utility power grid and will not be capable of selling electricity to a utility power distribution system. |
| Subpart TTTTa—Standards of Performance for Greenhouse Gas Emissions for Modified Coal-Fired Steam Electric Generating Units and New Construction and Reconstruction Stationary Combustion Turbine Electric Generating Units | n/a                                                                            | No             | The stationary combustion turbines will not sell electricity to a utility power distribution system.                                                                      |
| Subpart IIII—Standards of Performance for Stationary Compression Ignition Internal Combustion Engines                                                                                                                       | Engine-1, Engine-2, FPUMP1, FPUMP2, EGEN1 - EGEN6                              | Yes            | Engines manufactured after the applicable model year dates.                                                                                                               |
| Subpart Kc - Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984        | n/a                                                                            | No             | The tanks store ULSD fuel, which has a maximum vapor pressure less than 0.25 psia.                                                                                        |

## **7.2 National Emission Standards for Hazardous Air Pollutants (NESHAP)**

There are no NESHAPS in 40 CFR Part 61 promulgated by the US EPA pursuant to section 112 of the FCAA that apply to the Project.

## **7.3 Maximum Achievable Control Technologies for NESHAP Source Categories**

The following MACT standards promulgated under 40 CFR Part 63 apply to this Project:

### **Subpart A – General Provisions**

Project Matador will comply with the general reporting and testing requirements of the General Provisions, where applicable.

### **Subpart YYYY—National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines**

MACT Subpart YYYY, National Emission Standards for Stationary Gas Turbines applies to the combustion turbines. Fermi America's gas turbines are lean premix gas-fired units and will comply with the applicable standards, namely the concentration of formaldehyde will be limited to 91 ppbvd at 15% O<sub>2</sub>. Additionally, the oxidation catalyst will maintain a four-hour rolling inlet temperature within the range suggested by the manufacturer.

### **Subpart ZZZZ—National Emission Standard for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines**

The emergency generators and supplemental generators are subject to the requirements of 40 CFR 63 Subpart ZZZZ for Stationary Internal Combustion Engines (ICE). The emergency engines and black start generators are new compression ignition engines greater than 500 horsepower (HP) and thus will meet the formaldehyde limit of 580 ppbvd or less at 15 percent O<sub>2</sub> specified in Table 2A. Both types of engines will meet the operating temperature and pressure drop requirements specified in 40 CFR 63 Subpart ZZZZ, Table 2b. The Project Matador fire pump engines have a HP rating less than 500 HP and therefore do not have any requirements under Subpart ZZZZ.

See **Table 7-2** for MACT standards applicability determination and details of the applicable subparts. Fermi America will comply with all applicable requirements in 40 CFR Part 63.

**Table 7-2 40 CFR 63 NESHAP for Source Categories (MACT Standards)**

| <b>40 CFR 63 Subpart</b>                                                                                                                     | <b>Unit</b>                                                                    | <b>Applies</b> | <b>Basis for Applicability</b>                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|----------------|---------------------------------------------------------------------------------------------------------------------|
| Subpart A - General Provisions                                                                                                               | All Equipment Subject to a Subpart of 40 CFR 63                                | Yes            | All sources subject to a 40 CFR 63 Subpart are required to meet the general provisions in Subpart A, as applicable. |
| Subpart YYYY—National Emission Standards for Hazardous Air Pollutants for Stationary Combustion Turbines                                     | HSRGA1-HRSGA18, HSRGB1-HRSGB18, HSRGC1-HRSGC18, HSRGD1-HRSGD18, HSRGE1-HRSGE18 | Yes            | The combustion turbines are located at a major source of HAP emissions.                                             |
| Subpart ZZZZ - National Emissions Standards for Hazardous Air Pollutants for Stationary Reciprocating Internal Combustion Engines            | Engine 1, Engine 2, EGEN1 - EGEN6                                              | Yes            | The listed units are stationary reciprocating internal combustion engines (RICE) located at a major source of HAPs. |
| Subpart H - National Emission Standards for Organic Hazardous Air Pollutants for Equipment Leaks                                             | n/a                                                                            | No             | This subpart is only applicable if referenced by another subpart.                                                   |
| Subpart TT – National Emission Standards for Equipment Leaks – Control Level 1                                                               | n/a                                                                            | No             | This subpart is only applicable if referenced by another subpart.                                                   |
| Subpart UU– National Emission Standards for Equipment Leaks – Control Level 2 Standards                                                      | n/a                                                                            | No             | This subpart is only applicable if referenced by another subpart.                                                   |
| Subpart WW – National Emission Standards for Storage Vessels (Tanks) – Control Level 2                                                       | n/a                                                                            | No             | This subpart is only applicable if referenced by another subpart.                                                   |
| Subpart YY – National Emission Standards for Hazardous Air Pollutants for Source Categories: Generic Achievable Control Technology Standards | n/a                                                                            | No             | The plant is not one of the list source categories and therefore not subject to this subpart.                       |

## **7.4 Disaster Review**

This section addresses the assurance of regulatory compliance with TCEQ regulatory requirements and EPA regulations on Chemical Accident Prevention Provisions promulgated in 40 CFR Part 68. Fermi America will not store or handle any chemicals of concern in sufficient quantities or concentrations to trigger the requirement for a disaster review. The combined cycle CTGs will use 19-percent aqueous ammonia in the SCR system, which is not a chemical of concern with respect to disaster review. The quantity and concentration of the aqueous ammonia to be stored will not be subject to USEPA's Risk Management Program codified at 40 CFR 68.

### I. Applicant Information

**I acknowledge that I am submitting an authorized TCEQ application workbook and any necessary attachments. Except for inputting the requested data and adjusting row height and column width, I have not changed the TCEQ application workbook in any way, including but not limited to changing formulas, formatting, content, or protections.**

I agree

### A. Company Information

Company or Legal Name: Fermi Equipment Holdco LLC

Permits are issued to either the facility owner or operator, commonly referred to as the applicant or permit holder. List the legal name of the company, corporation, partnership, or person who is applying for the permit. We will verify the legal name with the Texas Secretary of State at (512) 463-5555 or at the link below.

<https://www.sos.state.tx.us>

Texas Secretary of State Charter/Registration  
Number (if given):

### B. Company Official Contact Information: must not be a consultant

Prefix (Mr., Ms., Dr., etc.): Mr.  
First Name: Charles  
Last Name: Hamilton  
Title: Director of Development  
Mailing Address: 600 S. Tyler, Suite 1501  
Address Line 2:  
City: Amarillo  
State: Texas  
ZIP Code: 79101  
Telephone Number: 806-789-4300  
Fax Number:  
Email Address: [charlie.hamilton@fermiamerica.com](mailto:charlie.hamilton@fermiamerica.com)

**C. Technical Contact Information:** This person must have the authority to make binding agreements and representations on behalf of the applicant and may be a consultant. **Additional technical contact(s) can be provided in a cover letter.**

Prefix (Mr., Ms., Dr., etc.): Ms.  
First Name: Elizabeth  
Last Name: Stanko  
Title: Director, Energy Transition Projects  
Company or Legal Name: TRC Environmental Corporation  
Mailing Address: 11767 Katy Fwy, Suite 850  
Address Line 2:  
City: Houston  
State: TX  
ZIP Code: 77079  
Telephone Number: 713-244-1039  
Fax Number:  
Email Address: [ESTanko@trccompanies.com](mailto:ESTanko@trccompanies.com)

### D. Assigned Numbers

The CN and RN below are assigned when a Core Data Form is initially submitted to the Central Registry. The RN is also assigned if the agency has conducted an investigation or if the agency has issued an enforcement action. If these numbers have not yet been assigned, leave these questions blank and include a Core Data Form with your application submittal. See Section VI.B. below for additional information.

|                                                                                                                                                                                                                                                                                                                                                                                                 |     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Enter the CN. The CN is a unique number given to each business, governmental body, association, individual, or other entity that owns, operates, is responsible for, or is affiliated with a regulated entity.                                                                                                                                                                                  | TBD |
| Enter the RN. The RN is a unique agency assigned number given to each person, organization, place, or thing that is of environmental interest to us and where regulated activities will occur. The RN replaces existing air account numbers. The RN for portable units is assigned to the unit itself, and that same RN should be used when applying for authorization at a different location. | TBD |

## II. Delinquent Fees and Penalties

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Does the applicant have unpaid delinquent fees and/or penalties owed to the TCEQ?<br>This form will not be processed until all delinquent fees and/or penalties owed to the TCEQ or the Office of the Attorney General on behalf of the TCEQ are paid in accordance with the Delinquent Fee and Penalty Protocol. For more information regarding Delinquent Fees and Penalties, go to the TCEQ Web site at the link below:<br><a href="https://www.tceq.texas.gov/agency/financial/fees/delin">https://www.tceq.texas.gov/agency/financial/fees/delin</a> | No |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|

## III. Permit Information

### A. Permit and Action Type (multiple may be selected, leave no blanks)

Additional information regarding the different NSR authorizations can be found at the link below:

<https://www.tceq.texas.gov/permitting/air/guidance/authorize.html>

Select from the dropdown the type of action being requested for each permit type. **If that permit type does not apply, you MUST select "Not applicable".**

Provide all assigned permit numbers relevant for the project. Leave blank if the permit number has not yet been assigned.

| Permit Type                                                                                                                                                                                                                        | Action Type Requested<br>(do not leave blank) | Permit Number (if assigned) |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|-----------------------------|
| Minor NSR (can be a Title V major source): <i>Not applicable, Initial, Amendment, Renewal, Renewal Certification, Renewal/Amendment, Relocation/Alteration, Change of Location, Alteration, Extension to Start of Construction</i> | Initial                                       | TBD                         |
| Special Permit: <i>Not applicable, Amendment, Renewal, Renewal Certification, Renewal/Amendment, Alteration, Extension to Start of Construction</i>                                                                                | Not applicable                                |                             |
| De Minimis: <i>Not applicable, Initial</i>                                                                                                                                                                                         | Not applicable                                |                             |
| Flexible: <i>Not applicable, Initial, Amendment, Renewal, Renewal Certification, Renewal/Amendment, Alteration, Extension to Start of Construction</i>                                                                             | Not applicable                                |                             |
| PSD: <i>Not applicable, Initial, Major Modification</i>                                                                                                                                                                            | Initial                                       | TBD                         |
| Nonattainment: <i>Not applicable, Initial, Major Modification</i>                                                                                                                                                                  | Not applicable                                |                             |

|                                                                                                                                                                                                                                                                                            |                |     |

| <b>F. Is a process description attached?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Yes |
| Does the process description emphasize where the emissions are generated, why the emissions must be generated, what air pollution controls are used (including process design features that minimize emissions), and where the emissions enter the atmosphere?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Yes |
| Does the process description also explain how the facility or facilities will be operating when the maximum possible emissions are produced?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Yes |
| <b>G. Is a detailed list of requested actions included in the application?</b> This list can be included in the project description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Yes |
| <b>H. Are detailed calculations attached? Calculations must be provided for each source with new or changing emission rates. For example, a new source, changing emission factors, decreasing emissions, consolidated sources, etc. Calculations do not need to be submitted for sources without any proposed emission rate changes. Note: the preferred format is an electronic workbook (such as Excel) with all formulas viewable for review.</b>                                                                                                                                                                                                                                                                                                                                                                                         | Yes |
| Are emission rates and associated calculations for planned MSS facilities and related activities attached?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Yes |
| <b>I. Is a material balance (Table 2, Form 10155) attached?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Yes |
| Table 2 (Form 10155), entitled Material Balance: A material balance representation may be required for all applications to confirm technical emissions information. Typically this is required for refining and chemical manufacturing processes involving reactions, separations, and blending. It may also be requested by the permit reviewer for other applications. Table 2 should represent the total material balance; that is, all streams into the system and all streams out. Additional sheets may be attached if necessary. Complex material balances may be presented on spreadsheets or indicated using process flow diagrams. All materials in the process should be addressed whether or not they directly result in the emission of an air contaminant. All production rates must be based on maximum operating conditions. |     |
| <b>J. Is a list of MSS activities attached?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Yes |
| Are the MSS activities listed and discussed separately, each complete with the authorization mechanism or emission rates, frequency, duration, and supporting information if authorized by this permit?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Yes |
| <b>K. Is a discussion of state regulatory requirements attached, addressing 30 TAC Chapters 101, 111, 112, 113, 115, and 117?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Yes |
| For all applicable chapters, does the discussion include how the facility will comply with the requirements of the chapter?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Yes |
| For all not applicable chapters, does the discussion include why the chapter is not applicable?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Yes |
| <b>M. Is a Public Involvement Plan (PIP) required for this project?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | No  |
| Requirements can be found at the following link: <a href="https://www.tceq.texas.gov/permitting/air#pip">https://www.tceq.texas.gov/permitting/air#pip</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |     |
| <b>N. Are all other required tables, calculations, and descriptions attached?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Yes |

|                                                                                                                                                                                                                                                                                             |

**C. Title 40 CFR Part 63**

|                                                                                   |               |
|-----------------------------------------------------------------------------------|---------------|
| Do MACT subpart(s) apply to a facility in this application?                       | Yes           |
| List applicable subparts you will demonstrate compliance with (e.g. Subpart VVVV) | A, YYYY, ZZZZ |

**IX. Emissions Review**

**A. Impacts Analysis**

Any change that may result in an increase in off-property concentrations of air contaminants requires an air quality impacts demonstration, which may include a qualitative analysis, the MERA, and/or modeling. Information regarding the air quality impacts demonstration must be provided with the application and show compliance with all state and federal requirements. Detailed requirements for the information necessary to make the demonstration are listed on the Impacts sheet.

|                                                                                                                                                  |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Are there any increases in short-term and/or long-term allowable emission rates?                                                                 | Yes |
| Can all the emission rate increases be attributed to speciation of currently authorized PM emissions and/or revisions of AP-42 or TCEQ guidance? | No  |
| Are there any new or modified control devices or emission sources?                                                                               | Yes |
| Are there any changes to emission point discharge parameters? Consider all parameters on the Stack Parameters sheet, including location.         | Yes |
| Will any PBR registrations, standard permit, or standard exemptions be incorporated by consolidation?                                            | No  |
| Does this project require an impacts analysis?                                                                                                   | Yes |

**B. Disaster Review**

If the proposed facility will handle sufficient quantities of certain chemicals which, if released accidentally, would cause off-property impacts that could be immediately dangerous to life and health, a disaster review analysis may be required as part of the application. Contact the appropriate NSR permitting section for assistance at (512) 239-1250. For additional guidance, see "Disaster Review Fact Sheet" at the webpage linked below.

|  |  |
|--|--|

**C. Air Pollutant Watch List**

Certain areas of the state have concentrations of specific pollutants that are of concern. The TCEQ has designated these portions of the state as watch list areas. Location of a facility in a watch list area could result in additional restrictions on emissions of the affected air pollutant(s) or additional permit requirements. The location of the areas and pollutants of interest can be found at the link below:

<https://www.tceq.texas.gov/toxicology/apwl/apwl.html>

|                                                        |    |
|--------------------------------------------------------|----|
| Is the proposed facility located in a watch list area? | No |
|                                                        |    |
|                                                        |    |

#### D. Mass Emissions Cap and Trade

|                                                                                                                                                                                  |    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
| Is this facility located at a site within the Houston/Galveston nonattainment area (Brazoria, Chambers, Fort Bend, Galveston, Harris, Liberty, Montgomery, and Waller Counties)? | No |
|                                                                                                                                                                                  |    |
|                                                                                                                                                                                  |    |
|                                                                                                                                                                                  |    |

#### X. Additional Requirements

##### A. Bulk Fuel Terminals

|                                           |    |
|-------------------------------------------|----|
| Is this project for a bulk fuel terminal? | No |
|                                           |    |
|                                           |    |
|                                           |    |
|                                           |    |
|                                           |    |

##### B. Plant Fuel Gas Facilities

|                                        |    |
|----------------------------------------|----|
| Does this site utilize plant fuel gas? | No |
|----------------------------------------|----|
